OFFICE OF PETITIONS

In re Patent No. 6,030,790  
Issue Date: February 29, 2000  
Application No. 08/817,547  
Filed: March 27, 1997  
Patentee: Adermann et al.

ON PETITION

This is a decision on the petition and papers filed by a third party under 37 CFR § 1.182 or 1.183 on July 15, 16, 19, 2002, which collectively oppose favorable treatment of the request for a Certificate of Correction asserted to have been filed on behalf of the true party in interest, such that USPTO processing of the request be delayed during pending concurrent litigation.

The third party petition is dismissed.

Third party petitioner who is asserted to be a defendant in litigation (Nichols Institute Diagnostics Inc. v. Scantibodies Clinical Laboratory, Inc., Civ. No. 02cv0046-B (LAB) filed May 15, 2002) involving this patent, opposes the above-noted request for a Certificate of Correction and seeks that it be refused by the USPTO.

Nevertheless, a third party does not have standing to request that the USPTO refuse to issue a Certificate of Correction. See Hallmark Cards, Inc. v. Lehman, 959 F. Supp. 539, 42 USPQ2d 1134 (D.D.C. 1997). Rather, any remedy that may be forthcoming to petitioner in this matter is more properly sought by petitioner before the court in the litigation already in progress. Id.; see also See Southwest Software, Inc. v. Harlequin Inc., 226 F.3d 1280, 56 USPQ2d 1161 (Fed. Cir. 2000). Furthermore, petitioner is not unduly prejudiced in this matter as the propriety of any change of inventorship effectuated by a Certificate of Correction is subject to judicial review. See Borden v. Occidental Petroleum Corp., 381 F.Supp. 1178, 1207, 182 USPQ 472 (S.D. Tex. 1974). Thus, when the requirements of 35 U.S.C. § 256 are met by the inventors, it is appropriate for the Director of the USPTO to perform the duty to issue the certificate in the ordinary way without delay. If the District Court reaches a different result on the merits, it may order correction under 35 U.S.C. § 256.

Lastly, a standard principle of statutory construction is: *expressio unius est exclusion*

*alterius* (the mention of one thing implies exclusion of another thing). See National R.R. Passenger Corp. v. National Ass'n of R.R. Passengers, 414 U.S. 453, 458 (1974); see also Botany Worsted Mills v. United States, 278 U.S. 282, 289 (1929) ("when a statute limits a thing to be done in a particular mode, it includes the negative of any other mode"). As the patent statute (35 U.S.C. § 301) specifically states what submissions by third parties may be placed in the file of a patent, the patent statute implicitly excludes other third party submissions, such as that herein, from being placed in the file of a patent. Accordingly, the third party papers are being returned herewith. Cf. Ex Parte Chambers et al., 20 USPQ 1470 (Comm'r Pat. 1991); In re Dubno, 12 USPQ2d 1153 (Comm'r Pat. 1989).

This patent file is being forwarded to Certificates of Correction Division.

Telephone inquiries concerning this decision may be directed to the undersigned at (703) 305-1820.

Hon. Rudi M. Brewster

1 I, M. Andrew Woodmansee, declare:

2 1. I am a member of the bar of the State of California and am with the law firm of  
3 Morrison & Foerster LLP, which represents Scantibodies Clinical Laboratory, Inc. and  
4 Scantibodies Laboratory, Inc. ("Scantibodies") in this matter. I have personal knowledge of the  
5 facts stated herein and, if called as a witness, I could and would testify competently as to them.

6 2. Attached as Exhibit A to this declaration is a true and correct copy of a certified  
7 translation from German to English of German patent number DE 44 34 555 A1.

8 3. Attached as Exhibit B to this declaration is a true and correct copy of a certified  
9 translation from German to English of an international patent application (WO 96/10041) filed  
10 with the World Intellectual Property Organization and published pursuant to the Patent  
11 Cooperation Treaty ("PCT WO 96/10041").

12 4. Attached as Exhibit C to this declaration is a true and correct copy of U.S. Patent No.  
13 6,030,790.

14 5. Attached as Exhibit D to this declaration is a copy of the initial U.S. Patent  
15 Application Serial No. 08/817547 and declarations filed with the United States Patent and  
16 Trademark Office, which issued as Patent No. 6,030,790.

17 6. Attached as Exhibit E to this declaration is a true and correct copy of the  
18 untranslated German patent number DE 44 34 555 A1.

19 7. Attached as Exhibit F to this declaration is a true and correct copy of the untranslated  
20 PCT Application WO 96/10041.

21 I declare under penalty of perjury under the laws of the United State that the  
22 foregoing is true and correct. Executed this 15 day of May 2002, at San Diego, California.

54. Peptides from the hPTH Sequence (1-37)

57. The invention relates to peptides from the human parathyroid (hPTH) sequence (1-37), containing  $\alpha$ -helical amino acid sequence regions and/or unstructured amino acid sequence regions, where said peptides are capable of inducing antibodies when injected into animals. The invention also relates to a diagnostic agent and antibodies obtainable by vaccination of animals with the peptides in question.

DE 197 33 666 A 1

The following information is taken from documentation  
filed by the Applicant.

**Peptides from the hPTH Sequence (1-37)**

This invention relates to peptides from the hPTH sequence (1-37), a diagnostic agent obtainable by vaccination of animals with the peptides, antibodies or fragments thereof, that can be obtained by vaccination of animals with the peptides, as well as the use of peptides for production of an agent for diagnosis of biologically active h-PTH.

Human parathyroid hormone (hPTH), a linear polypeptide of 84 amino acids, plays an important role in regulating the calcium metabolism. The metabolism of this hormone leads to a large number of C-terminal fragments whose biological function has not been clarified yet. Human PTH 1-37 has been detected as a circulating N-terminal fragment (EP-A 0 349 545). This fragment possesses the full biological activity of the complete hormone. This decreases substantially, however, upon loss of the first amino acid, serine, and is completely lost upon removal of the first two amino acids, serine and valine.

For the intact hormone, hPTH 1-84, and for the N-terminal fragment, serum concentrations have been measured in the area of  $10^{-12}$  mol/L. Immunological measurement techniques are used to detect such low concentrations. The most valid results are provided by the double-antibody or sandwich principle (e.g., two-site immunoradiometric assay (IRMA), or Sandwich Enzyme Linked Immunosorbent Assay (Sandwich ELISA)). These assays for hPTH 1-84 are available commercially. There is no assay for hPTH 1-34 using the double antibody principle.

Two antibodies are required for this. To avoid reciprocal steric hindrance, the method must recognize epitopes of the antigen located at a sufficient distance from each other. Vaccination with intact antigens results in a heterogeneous mixture of various antibodies that have to be purified before the sandwich assay. Of course, detecting a preferred immunoactive sequence in the region of amino acids 7-14 at the N terminus was possible previously based on theoretical calculations according to B.A. Jameson & H. Wolf, "The Antigenic Index: A Novel Algorithm for Predicting Antigenic Determinants", CABIOS 4, pp. 181-186, 1988. Vaccination with N-terminal fragments according to established methods leads, initially, to antibodies that bind in this amino acid region, as described for hPTH 1-34 (J. Tampe, P. Brozio, H.E. Manneck, A. Mißbichler, E. Blind, K.B. Müller, H. Schmidt-Gayk and F.P. Armbruster; "Characterization of Antibodies Against Human N-Terminal Parathyroid Hormone by Epitope Mapping"; J. Immunoassay 13, pp. 1-13, 1992). However, these antibodies cannot distinguish between biologically-active and biologically-inactive PTH 1-84 or fragments thereof missing the first two amino acids, serine and valine.

The problem to which the invention relates consists of specifying peptides that can help to eliminate the above disadvantages in diagnosing biologically-active h-PTH.

The technical problem discussed is solved surprisingly by peptides from the hPTH sequence (1-37) containing  $\alpha$ -helical amino acid sequence regions and/or unstructured amino acid sequence regions, where vaccination of animals with the peptides can induce antibodies. The peptides here preferably contain the N terminal  $\alpha$  helix in the region of amino acids 5-9, an unstructured section of amino acids 10-16 and/or a C terminal  $\alpha$  helix in the region of amino acid sequence 17-34 of the hPTH (1-37). The following peptides according to the invention are preferably used for the vaccination:

The primary structures of the above sequences represent essential characteristics of the secondary structure, as supported by the NMR data. A precondition for this was determining the secondary structure of PTH 1-37 in saline solution.

The structurally-remarkable regions cited have good immunogenic activity. Antibodies are formed that bind to the first amino acids of the N terminus. The lack of two amino acids already leads to a substantial loss of affinity. Since these amino acids are essential to biological activity, it is possible to obtain antibodies with the peptides according to the invention that recognize only hPTH and fragments thereof that are biologically active.

Furthermore, antibodies can be produced that detect the mid-region areas 9-15, and antibodies that bind the L terminal in the region of amino acids 30-37. According to the invention, therefore, antibodies can be produced against regions of hPTH 1-37 that do not have immunogenic effects based on theoretical calculations in the intact molecule. These regions are also located at such a distance from each other that there is no steric hindrance that would hinder the simultaneous binding of two antibodies.

In the preferred embodiment, the peptides can be modified at the N terminal end, the side chains and/or at the C terminal end, by acetylation, amidation, phosphorylation and/or glycosylation products.

Finally, peptides according to the invention can also be bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin or mouse serum albumin. They are preferably bound with the carrier protein through carbodiimide or formaldehyde.

The peptides according to the invention can be used to produce a diagnostic agent. The diagnostic agent according to the invention can be obtained by known vaccination of animals with at least one of the peptides according to the invention. After vaccination, an immunoglobulin fraction can be isolated from the vaccinated animals; the fraction contains antibody fractions that have an antibody titer against at least one of the peptides according to the invention. The antibodies thus obtained are also the subject of this invention. In an alternative embodiment, in addition to the complete antibodies consisting of  $F_{ab}$  and  $F_c$ , fragments thereof, such as  $F_{ab}$ , or fragments of antibodies are used; they are the idiotypes for the epitopes of the peptides.

The peptides according to the invention are suitable for production of an agent for diagnosing biologically-active h-PTH (1-37).

The invention is described in greater detail based on the following examples:

#### Example 1

##### Solid Phase Peptide Synthesis

The process for synthesis of peptides according to the invention is based on peptide synthesis on solid carriers. The C terminal amino acids are bound to the carrier material in the presence of dicyclohexylcarbodiimide and dimethylaminopyridine. The carrier material used for the synthesis is Wang resin or similar resins.

The following L-amino acid derivatives are used for the synthesis of the sequence, starting with the specified peptidyl resin: a) hPTH 1-10: Fmoc-Asn(Trt)-Wang resin, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-Arg(tBu)-OH. b) hPTH 9-18: Fmoc-Met-Wang resin, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH. c) hPTH 24-37: Fmoc-Leu-Wang resin, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

The synthesis can be carried out through in-situ activation with 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate (TBTU) or derivatives thereof, or with benzotriazol-1-yloxy-(trisdimethylamino)phosphonium hexafluorophosphate (BOP) or derivatives thereof, in the presence of diisopropyl ethylamine or N-methylmorpholine and 1-hydroxybenzotriazole, where a four- to ten-fold excess of Fmoc-L-amino acid is used during the couplings in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. The Fmoc groups are dissociated with 20% piperidine or 2% piperidine and 2% 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. After synthesis, the resin is washed with 2-propanol and dichloromethane and dried to a constant weight under a high vacuum.

For dissociation from the carrier and unblocking, the peptidyl resin is treated for 30 – 90 minutes at ambient temperature with trifluoroacetic acid containing 5% scavenger, water, ethanediol, phenol or thioanisole, then filtered, washed with trifluoroacetic acid and finally precipitated with tert-butyl methyl ether. The precipitate is lyophilized out of an aqueous solution.

### Example 2

#### Purification and Analysis

The raw product is purified by chromatography in a C-18 reverse phase column (10  $\mu$ m, Buffer A: 0.01 N HCl in water; Buffer B: 20% isopropanol, 30% methanol, 50% water, 0.01 N HCl; gradient: 10 – 80% in 60 minutes; detection 230 nm).

The purity of the product is determined by mass spectrometry and C18 reverse phase chromatography.

### Example 3

#### Coupling to Carrier Protein

Hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin or mouse serum albumin is used as a carrier protein. The coupling takes place according to the carbodiimide method, via the carboxyl groups of the peptide. The peptide is activated by a 5-minute treatment in an aqueous solution with 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide hydrochloride. Coupling occurs by the addition of the activated peptide to an aqueous solution of the carrier. The molar ratio is 1 peptide to 50 amino acids of the carrier protein. The treatment takes 4 hours.

The reaction is stopped by addition of sodium acetate in a final concentration of 100 mM. Incubate for 1 hour.

The protein-peptide conjugate is separated from the peptide by repeated dialysis over 100 mM of phosphate buffer, pH 7.2

### Example 4

#### Synthesis of Multiple Antigenic Peptides (MAP)

The triple lysine branch is achieved by binding Fmoc-L-lysine(Fmoc)-OH to C terminal alanine, bound to Wang resin, in three coupling cycles. Eight free amino functions are obtained by dissociation with piperidine; the sequences of human parathyroid hormone are synthesized at those functions according to the description above.

### Example 5

#### Vaccination

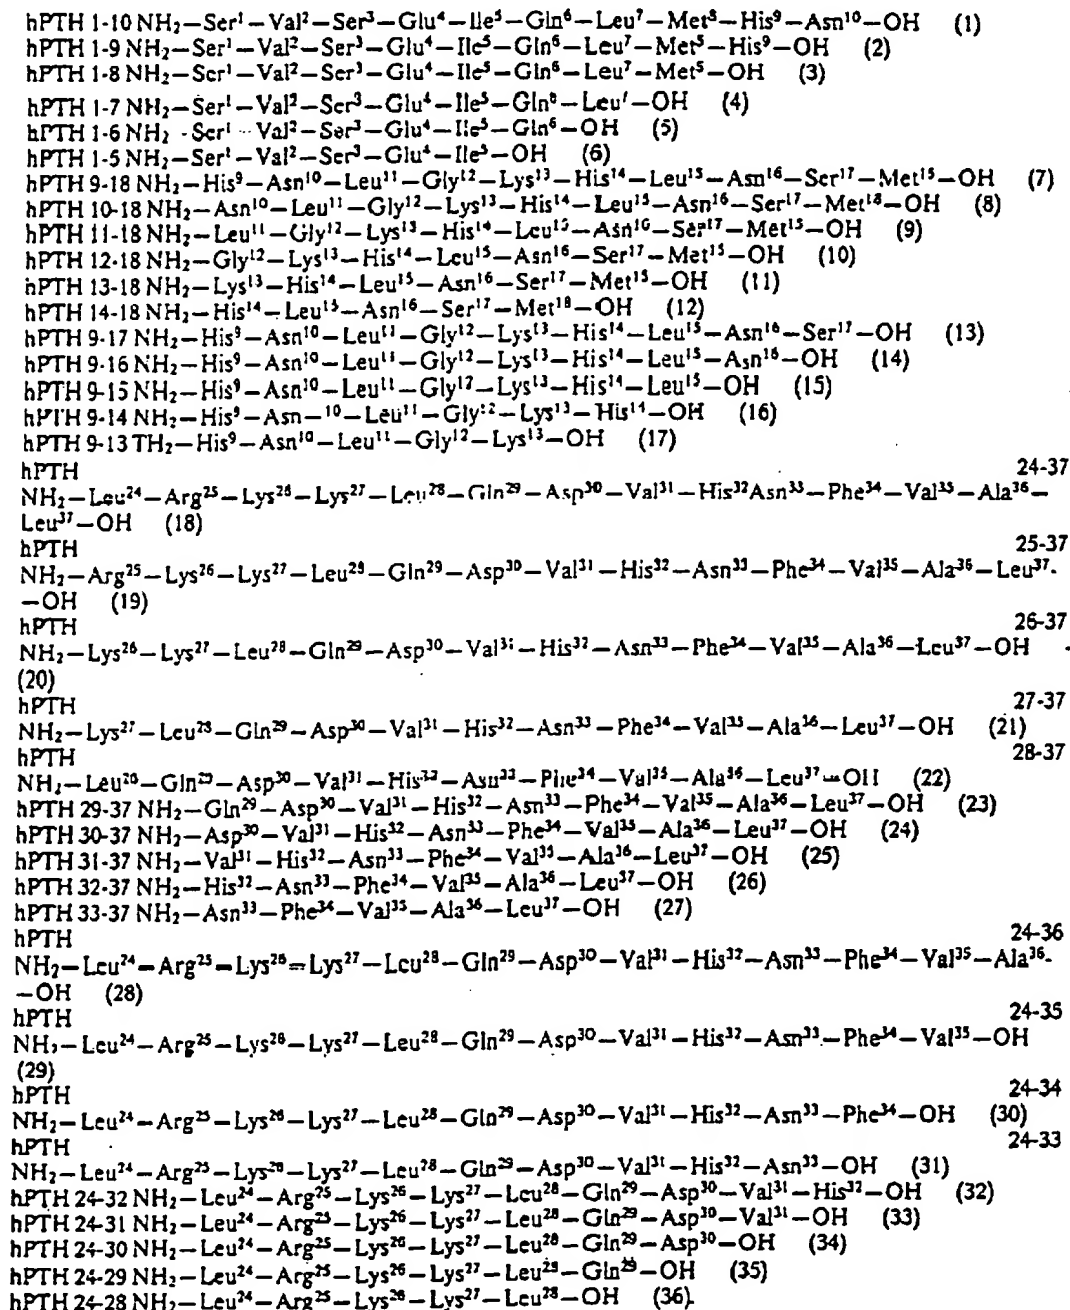

125  $\mu$ g of the carrier-peptide conjugate or MAP, dissolved in 250 ml water and emulsified with 250  $\mu$ l of complete Freund's adjuvant, is used per kg of body weight for the first vaccination. The emulsion is applied to the back in 10 separate SC injections.

Boosters are given similarly after 2-4 weeks. However, the complete Freund's adjuvant is replaced with incomplete Freund's adjuvant here.

### Patent Claims

We claim:

1. A peptide from the hPTH sequence (1-37) containing  $\alpha$ -helical amino acid sequence regions and/or unstructured amino acid sequence regions, wherein the peptides can induce antibodies upon injection into animals.
2. Peptides according to Claim 1, from hPTH (1-37), with the sequence:

3. Peptides according to Claim 1 and/or 2, modified at the N-terminal end, the side chains and/or the C-terminal end with acetylation, amidation, phosphorylation and/or glycosylation products, and/or bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin or mouse serum albumin.
4. A diagnostic agent obtainable by vaccination, known *per se*, of animals with at least one of the peptides according to at least one of the Claims 1 through 3, by obtaining fractions containing immunoglobulins from the vaccinated animals and by isolating fractions with an antibody titer against at least one of the peptides according to at least one of Claims 1 through 3 and that contains, if necessary, other adjuvants and/or carriers.
5. Antibody or fragments of antibodies obtained by vaccination of animals with at least one peptide according to at least one of Claims 1 through 3.
6. Use of the peptides according to at least one of Claims 1 through 3 for production of an agent for diagnosis of biologically-active h-PTH (1-37).

### Peptides from the hPTH Sequence (1-37)

This invention relates to peptides from the hPTH sequence (1-37), a diagnostic agent obtainable by vaccination of animals with the peptides, antibodies or fragments thereof, that can be obtained by vaccination of animals with the peptides, as well as the use of peptides for production of an agent for diagnosis of biologically active h-PTH.

Human parathyroid hormone (hPTH), a linear polypeptide of 84 amino acids, plays an important role in regulating the calcium metabolism. The metabolism of this hormone leads to a large number of C-terminal fragments whose biological function has not been clarified yet. Human PTH 1-37 has been detected as a circulating N-terminal fragment (EP-A 0 349 545). This fragment possesses the full biological activity of the complete hormone. This decreases substantially, however, upon loss of the first amino acid, serine, and is completely lost upon removal of the first two amino acids, serine and valine.

For the intact hormone, hPTH 1-84, and for the N-terminal fragment, serum concentrations have been measured in the area of  $10^{-12}$  mol/L. Immunological measurement techniques are used to detect such low concentrations. The most valid results are provided by the double-antibody or sandwich principle (e.g., two-site immunoradiometric assay (IRMA), or Sandwich Enzyme Linked Immunosorbent Assay (Sandwich ELISA)). These assays for hPTH 1-84 are available commercially. There is no assay for hPTH 1034 using the double antibody principle.

Two antibodies are required for this. To avoid reciprocal steric hindrance, the method must recognize epitopes of the antigen located at a sufficient distance from each other. Vaccination with intact antigens results in a heterogeneous mixture of

various antibodies that have to be purified before the sandwich assay. Of course, detecting a preferred immunoactive sequence in the region of amino acids 7-14 at the N terminus was possible previously based on theoretical calculations according to B.A. Jameson & H. Wolf, "The Antigenic Index: A Novel Algorithm for Predicting Antigenic Determinants", CABIOS 4, pp. 181-186, 1988. Vaccination with N-terminal fragments according to established methods leads, initially, to antibodies that bind in this amino acid region, as described for hPTH 1-34 (J. Tampe, P. Brozio, H.E. Manneck, A. Mißbichler, E. Blind, K.B. Müller, H. Schmidt-Gayk and F.P. Armbrüster; "Characterization of Antibodies Against Human N-Terminal Parathyroid Hormone by Epitope Mapping"; J. Immunoassay 13, pp. 1-13, 1992). However, these antibodies cannot distinguish between biologically-active and biologically-inactive PTH 1-84 or fragments thereof missing the first two amino acids, serine and valine.

The problem to which the invention relates consists of specifying peptides that can help to eliminate the above disadvantages in diagnosing biologically-active h-PTH.

The technical problem discussed is solved surprisingly by peptides from the hPTH sequence (1-37) containing  $\alpha$ -helical amino acid sequence regions and/or unstructured amino acid sequence regions, where vaccination of animals with the peptides can induce antibodies. The peptides here preferably contain the N terminal  $\alpha$  helix in the region of amino acids 5-9, an unstructured section of amino acids 10-16 and/or a C terminal  $\alpha$  helix in the region of amino acid sequence 17-34 of the hPTH (1-37). The following peptides according to the invention are preferably used for the vaccination:

hPTH 1-10

NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-Asn<sup>10</sup>-OH (1)

hPTH 1-9

NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-OH (2)

hPTH 1-8

NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-OH (3)

hPTH 1-7

NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-OH (4)

hPTH 1-6

## hPTH 24-29

## hPTH 24-28

The primary structures of the above sequences represent essential characteristics of the secondary structure, as supported by the NMR data. A precondition for this was determining the secondary structure of PTH 1-37 in saline solution.

The structurally-remarkable regions cited have good immunogenic activity. Antibodies are formed that bind to the first amino acids of the N terminus. The lack of two amino acids already leads to a substantial loss of affinity. Since these amino acids are essential to biological activity, it is possible to obtain antibodies with the peptides according to the invention that recognize only hPTH and fragments thereof that are biologically active.

Furthermore, antibodies can be produced that detect the mid-region areas 9-15, and antibodies that bind in the region of amino acids 30-37. According to the invention, therefore, antibodies can be produced against regions of hPTH 1-37 that do not have immunogenic effects based on theoretical calculations in the intact molecule. These regions are also located at such a distance from each other that there is no steric hindrance that would hinder the simultaneous binding of two antibodies.

In the preferred embodiment, the peptides can be modified at the N terminal end, the side chains and/or at the C terminal end, by acetylation, amidation, phosphorylation and/or glycosylation products.

Finally, peptides according to the invention can also be bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin or mouse serum albumin. They are preferably bound with the carrier protein through carbodiimide or formaldehyde.

The peptides according to the invention can be used to produce a diagnostic agent. The diagnostic agent according to the invention can be obtained by known vaccination of animals with at least one of the peptides according to the invention. After vaccination, an immunoglobulin fraction can be isolated from the vaccinated animals; the fraction contains antibody fractions that have an antibody titer against at least one of the peptides according to the invention. The antibodies thus obtained are also the subject of this invention. In an alternative embodiment, in addition to the complete antibodies consisting of  $F_{ab}$  and  $F_c$ , fragments thereof, such as  $F_{ab}$ , or fragments of antibodies are used; they are the idiotypes for the epitopes of the peptides.

The peptides according to the invention are suitable for production of an agent for diagnosing biologically-active h-PTH (1-37).

The invention is described in greater detail based on the following examples:

#### Example 1

##### Solid Phase Peptide Synthesis

The process for synthesis of peptides according to the invention is based on peptide synthesis on solid carriers. The C terminal amino acids are bound to the carrier material in the presence of

dicyclohexylcarbodiimide and dimethylaminopyridine. The carrier material used for the synthesis is Wang resin or similar resins.

The following L-amino acid derivatives are used for the synthesis of the sequence, starting with the specified peptidyl resin:

- a) hPTH 1-10: Fmoc-Asn(Trt)-Wang resin, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-Ser(tBu)-OH.
- b) hPTH 9-18: Fmoc-Met-Wang resin, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH.
- c) hPTH 24-37: Fmoc-Leu-Wang resin, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

The synthesis can be carried out through in-situ activation with 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate (TBTU) or derivatives thereof, or with benzotriazol-1-yloxy-trisdimethylamino phosphonium hexafluorophosphate (BOP) or derivatives thereof in the presence of diisopropyl ethylamine or N-methylmorpholine and 1-hydroxybenzotriazole, where a four- to ten-fold excess of Fmoc-L-amino acid is used during the couplings in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. The Fmoc groups are dissociated with 20% piperidine or 2% piperidine and 2% 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. After synthesis, the resin is washed with 2-propanol and dichloromethane and dried to a constant weight under a high vacuum.

For dissociation from the carrier and unblocking, the peptidyl resin is treated for 30 - 90 minutes at ambient temperature with trifluoroacetic acid containing 5% scavenger, water, ethanediol,

phenol or thioanisole, then filtered, washed with trifluoroacetic acid and finally precipitated with tert-butyl methyl ether. The precipitate is lyophilized out of an aqueous solution.

#### Example 2

##### Purification and Analysis

The raw product is purified by chromatography in a C-18 reverse phase column (10  $\mu$ m, Buffer A: 0.01 N HCl in water; Buffer B: 20% isopropanol, 30% methanol, 50% water, 0.01 N HCl; gradient: 10 - 80% in 60 minutes; detection 230 nm).

The purity of the product is determined by mass spectrometry and C18 reverse phase chromatography.

#### Example 3

##### Coupling to Carrier Protein

Hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin or mouse serum albumin is used as a carrier protein. The coupling takes place according to the carbodiimide method, via the carboxyl groups of the peptide. The peptide is activated by a 5-minute treatment in an aqueous solution with 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide hydrochloride. Coupling occurs by the addition of the activated peptide to an aqueous solution of the carrier. The molar ratio is 1 peptide to 50 amino acids of the carrier protein. The treatment takes 4 hours.

The reaction is stopped by addition of sodium acetate in a final concentration of 100 mM. Incubate for 1 hour.

The protein-peptide conjugate is separated from the peptide by repeated dialysis over 100 mM of phosphate buffer, pH 7.2

#### Example 4

##### Synthesis of Multiple Antigenic Peptides (MAP)

The triple lysine branch is achieved by binding Fmoc-L-lysine(Fmoc)-OH to C terminal alanine, bound to Wang resin, in three coupling cycles. Eight free amino functions are obtained by dissociation with piperidine; the sequences of human parathyroid hormone are synthesized at those functions according to the description above.

#### Example 5

##### Vaccination

125 µg of the carrier-peptide conjugate or MAP, dissolved in 250 ml water and emulsified with 250 µl of complete Freund's adjuvant, is used per kg of body weight for the first vaccination. The emulsion is applied to the back in 10 separate SC injections.

Boosters are given similarly after 2-4 weeks. However, the complete Freund's adjuvant is replaced with incomplete Freund's adjuvant here.

## Patent Claims

We claim:

1. A peptide from the hPTH sequence (1-37) containing  $\alpha$ -helical amino acid sequence regions and/or unstructured amino acid sequence regions, wherein the peptides can induce antibodies upon injection into animals.
2. Peptides according to Claim 1, from hPTH (1-37), with the sequence:

3. Peptides according to Claim 1 and/or 2, modified at the N-terminal end, the side chains and/or the C-terminal end with acetylation, amidation, phosphorylation and/or glycosylation products, and/or bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin or mouse serum albumin.
4. A diagnostic agent obtainable by vaccination, known *per se*, of animals with at least one of the peptides according to at least one of the Claims 1 through 3, by obtaining fractions containing immunoglobulins from the vaccinated animals and by isolating fractions with an antibody titer against at least one of the peptides according to at least one of Claims 1 through 3 and that contains, if necessary, other adjuvants and/or carriers.
5. Antibody or fragments of antibodies obtained by vaccination of animals with at least one peptide according to at least one of Claims 1 through 3.
6. Use of the peptides according to at least one of Claims 1 through 3 for production of an agent for diagnosis of biologically-active h-PTH (1-37).

The present invention is directed to peptides from the sequence of hPTH(1-37), which contain  $\alpha$ -helical amino acid sequence regions and/or non-structured amino acid sequence regions, said peptides being capable of inducing antibodies when injected into animals. Furthermore, the invention is directed to a diagnostic agent and antibodies obtainable by immunizing animals using the peptides according to the invention.

# ANTIBODIES THAT BIND PEPTIDES FROM THE hPTH SEQUENCE (1-37)

This application was filed under 35 U.S.C. § 371 and claims priority from PCT/EP95/03757, filed Sep. 22, 1995.

The present invention relates to peptides from the sequence of hPTH(1-37), and the use of said peptides in the preparation of an agent for diagnosing biologically active hPTH.

Human parathyroid hormone (hPTH), a linear polypeptide having 84 amino acids, plays an important role in the regulation of the calcium metabolism. The metabolism of this hormone gives rise to a large number of C-terminal fragments, the biological functions of which have not yet been elucidated. The hPTH(1-37) has been established as a circulating N-terminal fragment (EP-A 0 349 545). This fragment has the full biological activity of the entire hormone. However, upon loss of the first amino acid, serine, the activity significantly decreases and is lost completely without the first two amino acids, serine and valine.

Serum levels in the range of  $10^{-12}$  mol/l are measured for the intact hormone hPTH(1-84) and for the N-terminal fragment. Immunological measuring procedures are employed to determine such low concentrations. Here, the most valid results are provided by measuring procedures according to the double antibody or sandwich principle (e.g., the two-site radioimmunoassay, IRMA, or the sandwich enzyme-linked immuno sorbent assay, Sandwich ELISA). For hPTH(1-84), such assays are commercially available. For the measurement of hPTH(1-34), an assay according to the double antibody principle is not known.

Here, two antibodies are required. In order to avoid mutual steric hindrance, they must be capable of recognizing antigen epitopes located at a sufficient distance from each other. When immunizing using the intact antigen, a heterogeneous mixture of various antibodies is obtained, which first must be subjected to an expensive purification in order to conduct a sandwich assay. According to theoretical calculations by B. A. Jameson and H. Wolf, *The Antigenic Index: A Novel Algorithm for Predicting Antigenic Determinants*, CABIOS 4, p. 181-186, 1988; it has been possible so far to detect a preferred sequence having immunogenic activity in the region of the amino acids 7-14 at the N-terminus. Immunization with N-terminal fragments according to established methods predominantly results in antibodies which, as has been described for hPTH(1-34) (J. Tampe, P. Brozio, H. E. Manneck, A. Mißbichler, E. Blind, K. B. Millers, H. SchmidtGayk, and F. P. Armbruster, *Characterisation of Antibodies Against Human N-Terminal Parathyroid Hormone by Epitope Mapping*; *J. Immunoassay* 13, p. 1-13, 1992), bind in the region of these amino acids. However, these antibodies are not capable of discriminating between biologically active and biologically inactive PTH (1-84) or fragments thereof lacking the first two amino acids serine and valine.

The technical problem which this invention is based upon is to provide peptides by means of which it is possible to eliminate the above-mentioned drawbacks in the diagnosis of biologically active hPTH.

Surprisingly, the technical problem described above is solved by means of the following peptides from the sequence of hPTH(1-37):

- hPTH 1-10 SEQ I.D. NO.1

The indicated sequences represent essential features of the secondary structure in their primary structure, as can be demonstrated by supporting NMR data. One precondition to this end was a determination of the PTH(1-37) secondary structure in physiological solution.

The above-mentioned regions of conspicuous structure have good immunogenic activity. Antibodies are formed, binding to the first amino acids of the N-terminus. Deficiency of only two amino acids gives rise to a substantial loss in affinity. Because these amino acids are indispensable

for the biological activity to arise, it is possible by using the peptides of the invention to obtain antibodies recognizing only hPTH and fragments thereof which are biologically active.

Furthermore, antibodies can be produced which detect the mid-region 9-15, as well as antibodies giving C-terminal binding in the region of the amino acids 30-37. According to the invention, it is therefore possible to produce antibodies against hPTH(1-37) regions which, according to theoretical calculations, do not exhibit immunogenic activity within the entire molecule. In addition, these regions are separated from each other by such a far distance that no steric hindrance is present which would prevent simultaneous binding of two antibodies.

In preferred embodiments, the peptides may be modified at the N-terminal end, in the side-chain and/or at the C-terminal end, namely, taking the form of acetylation, amidation, phosphorylation and/or glycosylation products.

Eventually, the peptides of the invention may also be bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin, or mouse serum albumin etc. Binding to the carrier proteins is preferably effected using carbodiimide or formaldehyde.

The peptides of the invention may be used in the preparation of a diagnostic agent. The diagnostic agent of the invention can be obtained using the per se known immunization of animals with at least one of the peptides according to the invention. Following immunization, an immunoglobulin fraction can be isolated from the immunized animals, which contains antibody fractions having an antibody titer against at least one of the peptides of the invention. The invention is also directed to the antibodies thus obtained. In addition to the complete antibodies consisting of F<sub>ab</sub> and F<sub>c</sub> fragments thereof such as F<sub>ab</sub> or fragments of the antibodies being idiotypes of peptide epitopes may also be used in an alternative embodiment.

The peptides according to the invention are suitable for preparing an agent for the diagnosis of biologically active hPTH(1-37).

Referring to the following examples, the invention will be described in more detail.

#### EXAMPLE 1

##### Solid-Phase Synthesis of Peptides

The method of the invention for synthesizing the peptides is based on the peptide synthesis using a solid support. Each of the C-terminal amino acids is bound to the support material in the presence of dicyclohexylcarbodiimide and dimethylaminopyridine. Wang resin or similar resins are used as support material for the syntheses.

The following derivatives of L-amino acids are used in the synthesis of the sequence, starting from the peptidyl resin as specified: a) hPTH(1-10) Seq. I.D. No. 1: Fmoc-Asn(Trt)-Wang resin, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-

Ser(tBu)-OH; b) hPTH(9-18) Seq. I.D. No. 7: Fmoc-Met-Wang resin, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH; c) hPTH(24-37) Seq. I.D. No. 18: Fmoc-Leu-Wang resin, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

The synthesis may be carried out by in situ activation using 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate (TBTU) or derivatives thereof, or benzotriazol-1-yloxy-tris(dimethylamino)phosphonium hexafluorophosphate (BOP) or derivatives thereof in the presence of diisopropylethylamine or N-methylmorpholine and 1-hydroxybenzotriazole, using a four- to tenfold excess of Fmoc-L-amino acid during the coupling reactions in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. Removal of the Fmoc groups is effected using 20% piperidine or 2% piperidine and 2% 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. Following synthesis, the resins are washed with 2-propanol and dichloromethane and dried to constant weight in a high vacuum.

Removal from the support and deprotection are carried out by reacting the peptidyl resin with trifluoroacetic acid containing 5% scavenger, water, ethanediol, phenol or thioanisole for 30-90 minutes at room temperature, filtering, washing with trifluoroacetic acid, and subsequently precipitating with tert-butyl methyl ether. The precipitate is lyophilized from aqueous solution.

#### EXAMPLE 2

##### Purification and Analysis

The raw products are purified by chromatography on a C18 reversed phase column (10  $\mu$ m, buffer A: 0.01 N HCl in water; buffer B: 20% isopropanol, 30% methanol, 50% water, 0.01 N HCl; gradient: 10-80% within 60 minutes; detection at 230 nm).

The purity of the products is determined using mass spectrometry and C18 reversed phase chromatography.

#### EXAMPLE 3

##### Coupling to Carrier Protein

Used as carrier proteins are hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin, or mouse serum albumin. Coupling is performed according to the carbodiimide method by way of the carboxyl groups of the peptides. The peptide is activated in aqueous solution by reaction with 1-ethyl-3-(3-methylaminopropyl)carbodiimide hydrochloride for 5 minutes. Coupling is effected by adding the activated peptide to an aqueous solution of the carrier. The molar ratio is 1 peptide 50 amino acids of the carrier protein. The reaction takes 4 hours.

#### SEQUENCE LISTING

(1) GENERAL INFORMATION:

(iii) NUMBER OF SEQUENCES: 36

-continued

## (2) INFORMATION FOR SEQ ID NO: 1:

- (i) SEQUENCE CHARACTERISTICS:
  - (A) LENGTH: 10 amino acids
  - (B) TYPE: amino acid
  - (C) STRANDEDNESS: unknown
  - (D) TOPOLOGY: unknown

(ii) MOLECULE TYPE: peptide

(iii) HYPOTHETICAL: no

(iv) ANTI-SENSE: no

(xi) SEQUENCE DESCRIPTION: SEQ ID NO: 1:

Ser Val Ser Glu Ile Gln Leu Met His Asn  
 1                   5                   10

## (2) INFORMATION FOR SEQ ID NO: 2:

- (i) SEQUENCE CHARACTERISTICS:
  - (A) LENGTH: 9 amino acids
  - (B) TYPE: amino acid
  - (C) STRANDEDNESS: unknown
  - (D) TOPOLOGY: unknown

(ii) MOLECULE TYPE: peptide

(iii) HYPOTHETICAL: no

(iv) ANTI-SENSE: no

## We claim:

1. A kit for detecting active human parathyroid hormone (hPTH) comprising a container and a first group of antibodies or antibody fragments and a second group of antibodies or antibody fragments, wherein the first group selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 1-6 and the second group selectively binds hPTH at an epitope contained within amino acids 24 to 37.

2. The kit of claim 1, wherein the second group of antibodies or antibody fragments selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 18-36.

3. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 1.

4. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 2.

5. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 3.

6. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 4.

7. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 5.

8. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 6.

9. An immunological method of detecting active human parathyroid hormone (hPTH) in a sample comprising:

contacting the sample with a first antibody or antibody fragment which selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 1-6, wherein the first antibody or antibody fragment binds hPTH in the sample;

contacting the sample with a second antibody or antibody fragment which selectively binds hPTH at an epitope contained within amino acids 24 to 37; wherein the second antibody or antibody fragment binds to hPTH bound by the first antibody or antibody fragment; and

detecting the binding of the first and second antibodies or antibody fragments, wherein the binding of the first and second antibodies or antibody fragments indicates the presence of active hPTH in the sample.

10. The method of claim 9, wherein the second antibody or antibody fragment selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 18-36.

11. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 1.

12. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 2.

13. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 3.

14. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 4.

15. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 5.

16. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 6.

17. A composition comprising an antibody or antibody fragment and a suitable carrier, wherein the antibody or antibody fragment selectively binds a peptide of human parathyroid hormone (hPTH) selected from the group consisting of peptides having SEQ. ID. Nos. 1-6.

18. The composition of claim 17, wherein the composition further comprises a second antibody or antibody fragment, wherein the second antibody or antibody fragment selectively binds hPTH at an epitope contained within amino acids 24 to 37.

19. The composition of claim 17, wherein the second antibody or antibody fragment selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 18-36.

20. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 1.

21. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 2.

22. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 3.

23. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 4.

24. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 5.

25. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 6.

Peptides from the hPTH(1-37) Sequence

Inv D'

The present invention relates to peptides from the sequence of hPTH(1-37), and the use of said peptides in the preparation of an agent for diagnosing biologically active hPTH.

Human parathyroid hormone (hPTH), a linear polypeptide having 84 amino acids, plays an important role in the regulation of the calcium metabolism. The metabolism of this hormone gives rise to a large number of C-terminal fragments, the biological functions of which have not yet been elucidated. The hPTH(1-37) has been established as a circulating N-terminal fragment (EP-A 0 349 545). This fragment has the full biological activity of the entire hormone. However, upon loss of the first amino acid, serine, the activity significantly decreases and is lost completely without the first two amino acids, serine and valine.

Serum levels in the range of  $10^{-12}$  mol/l are measured for the intact hormone hPTH(1-84) and for the N-terminal fragment. Immunological measuring procedures are employed to determine such low concentrations. Here, the most valid results are provided by measuring procedures according to the double antibody or sandwich principle (e.g., the two-site radioimmunoassay, IRMA, or the sandwich enzyme-linked immuno sorbent assay, Sandwich ELISA). For hPTH(1-84), such assays are commercially available. For the measurement of hPTH(1-34), an assay according to the double antibody principle is not known.

Here, two antibodies are required. In order to avoid mutual steric hindrance, they must be capable of recognizing antigen epitopes located at a sufficient distance from each other. When immunizing using the intact antigen, a heteroge-

Art. 341

- 2 -

neous mixture of various antibodies is obtained, which first must be subjected to an expensive purification in order to conduct a sandwich assay. According to theoretical calculations by B.A. Jameson and H. Wolf, The Antigenic Index: A Novel Algorithm for Predicting Antigenic Determinants, CABIOS 4, p. 181-186, 1988; it has been possible so far to detect a preferred sequence having immunogenic activity in the region of the amino acids 7-14 at the N-terminus. Immunization with N-terminal fragments according to established methods predominantly results in antibodies which, as has been described for hPTH(1-34) (J. Tampe, P. Brozio, H.E. Manneck, A. Mißbichler, E. Blind, K.B. Millers, H. Schmidt-Gayk, and F.P. Armbruster, Characterisation of Antibodies Against Human N-Terminal Parathyroid Hormone by Epitope Mapping; J. Immunoassay 13, p. 1-13, 1992), bind in the region of these amino acids. However, these antibodies are not capable of discriminating between biologically active and biologically inactive PTH(1-84) or fragments thereof lacking the first two amino acids serine and valine.

The technical problem which this invention is based upon is to provide peptides by means of which it is possible to eliminate the above-mentioned drawbacks in the diagnosis of biologically active hPTH.

Surprisingly, the technical problem described above is solved by means of the following peptides from the sequence of hPTH(1-37):

D hPTH 1-10 SEQ. ID. NO. 1  
NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-Asn<sup>10</sup>-OH (1)

- [illegible]

The indicated sequences represent essential features of the secondary structure in their primary structure, as can be demonstrated by supporting NMR data. One precondition to this end was a determination of the PTH(1-37) secondary structure in physiological solution.

The above-mentioned regions of conspicuous structure have good immunogenic activity. Antibodies are formed, binding to the first amino acids of the N-terminus. Deficiency of only two amino acids gives rise to a substantial loss in affinity. Because these amino acids are indispensable for the biological activity to arise, it is possible by using the peptides of the invention to obtain antibodies recognizing only hPTH and fragments thereof which are biologically active.

Furthermore, antibodies can be produced which detect the mid-region 9-15, as well as antibodies giving C-terminal binding in the region of the amino acids 30-37. According to the invention, it is therefore possible to produce antibodies against hPTH(1-37) regions which, according to theoretical calculations, do not exhibit immunogenic activity within the entire molecule. In addition, these regions are separated from each other by such a far distance that no steric hindrance is present which would prevent simultaneous binding of two antibodies.

In preferred embodiments, the peptides may be modified at the N-terminal end, in the side-chain and/or at the C-terminal end, namely, taking the form of acetylation, amidation, phosphorylation and/or glycosylation products.

Ch. 34

- 7 -

Eventually, the peptides of the invention may also be bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin, or mouse serum albumin etc.. Binding to the carrier proteins is preferably effected using carbodiimide or formaldehyde.

The peptides of the invention may be used in the preparation of a diagnostic agent. The diagnostic agent of the invention can be obtained using the per se known immunization of animals with at least one of the peptides according to the invention. Following immunization, an immunoglobulin fraction can be isolated from the immunized animals, which contains antibody fractions having an antibody titer against at least one of the peptides of the invention. The invention is also directed to the antibodies thus obtained. In addition to the complete antibodies consisting of  $F_{ab}$  and  $F_c$ , fragments thereof such as  $F_{ab}$  or fragments of the antibodies being idiotypes of peptide epitopes may also be used in an alternative embodiment.

The peptides according to the invention are suitable for preparing an agent for the diagnosis of biologically active hPTH(1-37).

Referring to the following examples, the invention will be described in more detail.

# Example 1

## Solid-Phase Synthesis of Peptides

The method of the invention for synthesizing the peptides is based on the peptide synthesis using a solid support. Each of the C-terminal amino acids is bound to the support material in the presence of dicyclohexylcarbodiimide and dimethylaminopyridine. Wang resin or similar resins are used as support material for the syntheses.

The following derivatives of L-amino acids are used in the synthesis of the sequence, starting from the peptidyl resin as specified: a) hPTH(1-10): <sup>See, i.p. No. 1</sup> Fmoc-Asn(Trt)-Wang resin, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, <sup>See, i.p. No. 2</sup> Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-Ser(tBu)-OH; b) hPTH(9-18): <sup>See, i.p. No. 2</sup> Fmoc-Met-Wang resin, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH; c) hPTH(24-37): <sup>See, i.p. No. 18</sup> Fmoc-Leu-Wang resin, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

The synthesis may be carried out by in situ activation using 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate (TBTU) or derivatives thereof, or benzotriazol-1-yloxy-tris(dimethylamino)phosphonium hexafluorophosphate (BOP) or derivatives thereof in the presence of diisopropylethylamine or N-methylmorpholine and 1-hydroxybenzotriazole, using a four- to tenfold excess of Fmoc-L-amino acid during the coupling reactions in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. Removal of the Fmoc groups is effected using 20% piperidine

Art 34

- 9 -

or 2% piperidine and 2% 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. Following synthesis, the resins are washed with 2-propanol and dichloromethane and dried to constant weight in a high vacuum.

Removal from the support and deprotection are carried out by reacting the peptidyl resin with trifluoroacetic acid containing 5% scavenger, water, ethanediol, phenol or thioanisole for 30-90 minutes at room temperature, filtering, washing with trifluoroacetic acid, and subsequently precipitating with tert-butyl methyl ether. The precipitate is lyophilized from aqueous solution.

#### Example 2

#### Purification and Analysis

The raw products are purified by chromatography on a C18 reversed phase column (10  $\mu$ m, buffer A: 0.01 N HCl in water; buffer B: 20% isopropanol, 30% methanol, 50% water, 0.01 N HCl; gradient: 10-80% within 60 minutes; detection at 230 nm).

The purity of the products is determined using mass spectrometry and C18 reversed phase chromatography.

#### Example 3

#### Coupling to Carrier Protein

Used as carrier proteins are hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin, or mouse serum albumin. Coupling is performed according to the carbodiimide method by way of the carboxyl groups of the peptides. The peptide is

DBB 547-032797

Art. 3

- 10 -

activated in aqueous solution by reaction with 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride for 5 minutes. Coupling is effected by adding the activated peptide to an aqueous solution of the carrier. The molar ratio is 1 peptide on 50 amino acids of the carrier protein. The reaction takes 4 hours.

# Abstract

The present invention is directed to peptides from the sequence of hPTH(1-37), which contain  $\alpha$ -helical amino acid sequence regions and/or non-structured amino acid sequence regions, said peptides being capable of inducing antibodies when injected into animals. Furthermore, the invention is directed to a diagnostic agent and antibodies obtainable by immunizing animals using the peptides according to the invention.

## Beschreibung

Die vorliegende Erfindung betrifft Peptide aus der Sequenz des hPTH (1-37), ein Diagnostikum erhältlich durch Immunisierung von Tieren mit den Peptiden, Antikörper oder deren Fragmente erhältlich durch Immunisierung von Tieren mit den Peptiden sowie die Verwendung der Peptide zur Herstellung eines Mittels zur Diagnose von biologisch aktiven h-PTH.

Humanes Parathormon (hPTH), ein lineares Polypeptid aus 84 Aminosäuren, spielt eine wichtige Rolle in der Regulation des Calciumstoffwechsels. Der Metabolismus dieses Hormons führt zu einer großen Zahl C-terminaler Fragmente, deren biologische Funktion noch nicht geklärt ist. Als zirkulierendes N-terminales Fragment ist das hPTH 1-37 festgelegt (EP-A 0 349 545). Dieses Fragment besitzt die volle biologische Aktivität des Gesamthormons. Diese nimmt allerdings bei Verlust der ersten Aminosäure, Serin, deutlich ab und geht ohne die ersten beiden Aminosäuren, Serin und Valin, völlig verloren.

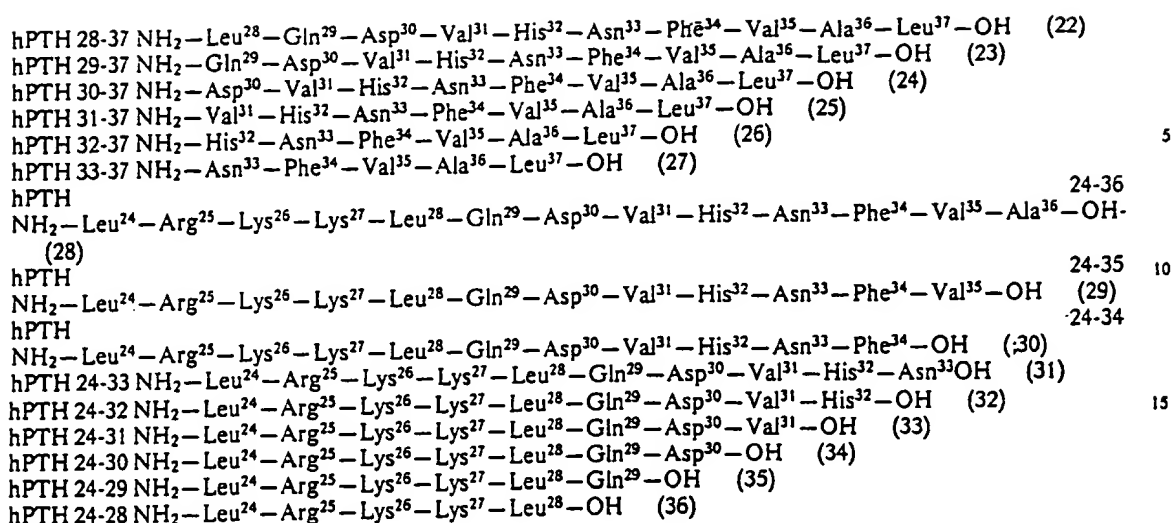

Für das intakte Hormon hPTH 1-84 und für N-terminale Fragmente werden Serumkonzentrationen im Bereich von 10-12 mol/L gemessen. Zur Bestimmung solcher niedriger Konzentrationen bedient man sich immunologischer Meßverfahren. Die validesten Ergebnisse liefern hierbei Meßverfahren nach dem Doppelantikörper oder Sandwich Prinzip (z. B. Two-site Radioimmunometric Assay, IRMA oder Sandwich Enzym Linked Immuno Sorbent Assay, Sandwich ELISA). Solche Assays sind für hPTH 1-84 kommerziell erhältlich. Zur Messung von hPTH 1-34 ist ein Assay nach dem Doppelantikörper-Prinzip nicht bekannt.

Hierfür sind zwei Antikörper notwendig. Diese müssen, um eine gegenseitige sterische Hinderung zu vermeiden, Epitope des Antigens erkennen, die in ausreichender Entfernung zueinander liegen. Bei Immunisierung mit dem intakten Antigen erhält man ein heterogenes Gemisch unterschiedlicher Antikörper, die für einen Sandwich-Assay erst aufwendig gereinigt werden müssen. Zwar war es bisher möglich aufgrund theoretischer Berechnungen nach B.A. Jameson & H. Wolf, The antigenic index: a novel algorithm for predicting antigenic determinants, CABIOS 4, p 181 - 186, 1988 am N-Terminus eine bevorzugte immunogen wirkende Sequenz im Bereich der Aminosäuren 7 - 14 festzustellen. Eine Immunisierung mit N-terminalen Fragmenten nach etablierten Methoden führt in erster Linie zu Antikörpern, die, wie für hPTH 1-34 beschrieben (J. Tampe, P. Brozio, H.E. Manneck, A. Mißbichler, E. Blind, K.B. Müller, H. Schmidt-Gayk und F.P. Armbruster; Characterisation of antibodies against human N-terminal parathyroid hormone by epitope mapping; J. Immunoassay 13 S. 1 - 13, 1992), in dem Bereich dieser Aminosäuren binden. Diese Antikörper können aber nicht zwischen biologisch aktiven und biologisch inaktiven PTH 1-84 oder Fragmenten davon, denen die ersten beiden Aminosäuren Serin und Valin fehlen, unterscheiden.

Das der Erfindung zugrunde liegende technische Problem besteht darin, Peptide anzugeben, mit deren Hilfe die oben genannten Nachteile der Diagnose von biologisch aktivem h-PTH beseitigt werden können.

Das angesprochene technische Problem wird überraschenderweise gelöst durch Peptide aus der Sequenz des hPTH (1-37) enthaltend  $\alpha$ -helicale Aminosäuresequenzbereiche und/oder nicht strukturierte Aminosäuresequenzbereiche, wobei die Peptide bei Injektion in Tiere Antikörper zu induzieren vermögen. Dabei enthalten die Peptide vorzugsweise die N-terminale  $\alpha$ -Helix im Bereich der Aminosäuren 5-9, einen unstrukturierten Abschnitt der Aminosäuren 10-16 und/oder eine C-terminale  $\alpha$ -Helix im Bereich der Aminosäuresequenz 17-34 des hPTH (1-37). Vorzugsweise werden die folgenden erfindungsgemäßen Peptide zur Immunisierung verwendet:

- hPTH 1-10  $\text{NH}_2$ -Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-Asn<sup>10</sup>-OH (1)  
hPTH 1-9  $\text{NH}_2$ -Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-OH (2)  
hPTH 1-8  $\text{NH}_2$ -Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-OH (3)  
hPTH 1-7  $\text{NH}_2$ -Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-OH (4)  
hPTH 1-6  $\text{NH}_2$ -Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-OH (5)  
hPTH 1-5  $\text{NH}_2$ -Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-OH (6)  
hPTH 9-18  $\text{NH}_2$ -His<sup>9</sup>-Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-Met<sup>18</sup>-OH (7)  
hPTH 10-18  $\text{NH}_2$ -Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-Met<sup>18</sup>-OH (8)  
hPTH 11-18  $\text{NH}_2$ -Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-Met<sup>18</sup>-OH (9)  
hPTH 12-18  $\text{NH}_2$ -Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-Met<sup>18</sup>-OH (10)  
hPTH 13-18  $\text{NH}_2$ -Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-Met<sup>18</sup>-OH (11)  
hPTH 14-18  $\text{NH}_2$ -His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-Met<sup>18</sup>-OH (12)  
hPTH 9-17  $\text{NH}_2$ -His<sup>9</sup>-Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-Ser<sup>17</sup>-OH (13)  
hPTH 9-16  $\text{NH}_2$ -His<sup>9</sup>-Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-Asn<sup>16</sup>-OH (14)  
hPTH 9-15  $\text{NH}_2$ -His<sup>9</sup>-Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-Leu<sup>15</sup>-OH (15)  
hPTH 9-14  $\text{NH}_2$ -His<sup>9</sup>-Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-His<sup>14</sup>-OH (16)  
hPTH 9-13  $\text{NH}_2$ -His<sup>9</sup>-Asn<sup>10</sup>-Leu<sup>11</sup>-Gly<sup>12</sup>-Lys<sup>13</sup>-OH (17)  
hPTH 24-37  
 $\text{NH}_2$ -Leu<sup>24</sup>-Arg<sup>25</sup>-Lys<sup>26</sup>-Lys<sup>27</sup>-Leu<sup>28</sup>-Gln<sup>29</sup>-Asp<sup>30</sup>-Val<sup>31</sup>-His<sup>32</sup>-Asn<sup>33</sup>-Phe<sup>34</sup>-Val<sup>35</sup>-Ala<sup>36</sup>-Leu<sup>37</sup>-OH (18)  
hPTH 25-37  
 $\text{NH}_2$ -Arg<sup>25</sup>-Lys<sup>26</sup>-Lys<sup>27</sup>-Leu<sup>28</sup>-Gln<sup>29</sup>-Asp<sup>30</sup>-Val<sup>31</sup>-His<sup>32</sup>-Asn<sup>33</sup>-Phe<sup>34</sup>-Val<sup>35</sup>-Ala<sup>36</sup>-Leu<sup>37</sup>-OH (19)  
hPTH 26-37  
 $\text{NH}_2$ -Lys<sup>26</sup>-Lys<sup>27</sup>-Leu<sup>28</sup>-Gln<sup>29</sup>-Asp<sup>30</sup>-Val<sup>31</sup>-His<sup>32</sup>-Asn<sup>33</sup>-Phe<sup>34</sup>-Val<sup>35</sup>-Ala<sup>36</sup>-Leu<sup>37</sup>-OH (20)  
hPTH 27-37  
 $\text{NH}_2$ -Lys<sup>27</sup>-Leu<sup>28</sup>-Gln<sup>29</sup>-Asp<sup>30</sup>-Val<sup>31</sup>-His<sup>32</sup>-Asn<sup>33</sup>-Phe<sup>34</sup>-Val<sup>35</sup>-Ala<sup>36</sup>-Leu<sup>37</sup>-OH (21)

Die genannten Sequenzen repräsentieren in ihrer Primärstruktur wesentliche Merkmale der Sekundärstruktur, wie sich durch NMR-Daten unterstützend belegen läßt. Voraussetzung dazu war eine Festlegung der Sekundärstruktur für PTH 1-37 in physiologischer Lösung.

Die genannten strukturell auffälligen Bereiche wirken gut immunogen. Es werden Antikörper gebildet, die an den ersten Aminosäuren des N-Terminus binden. Bereits das Fehlen von zwei Aminosäuren führt zu einem erheblichen Affinitätsverlust. Da diese Aminosäuren zur Ausübung der biologischen Wirkung unerlässlich sind, ist es mit dem erfindungsgemäßen Peptid möglich Antikörper zu erhalten, die nur hPTH und Fragmente davon erkennen, die biologisch aktiv sind.

Weiterhin sind Antikörper herstellbar, die den midregionalen Bereich 9-15 detektieren, und Antikörper die L-terminal im Bereich der Aminosäuren 30-37 binden. Erfindungsgemäß können also Antikörper gegen Bereiche des hPTH 1-37 produziert werden, die aufgrund theoretischer Berechnungen im Gesamtmolekül nicht immunogen wirken. Diese Bereiche liegen zudem soweit auseinander, daß keine sterische Hinderung vorliegt, die ein gleichzeitiges Binden zweier Antikörper verhindern würde.

Die Peptide können in bevorzugten Ausführungsformen am N-terminalen Ende, in der Seitenkette und/oder am C-terminalen Ende modifiziert sein, und zwar in Form von Acetylierungs-, Amidierungs-, Phosphorylierungs- und/oder Glycosylierungsprodukten.

Schließlich können erfindungsgemäße Peptide auch an Carrierproteine wie Hämocyanin, Thyroglobulin, Rinderserumalbumin, Ovalalbumin oder Mauserumalbumin etc. gebunden sein. Die Bindung an die Carrierproteine erfolgt vorzugsweise durch Carbodiimid oder Formaldehyd.

Die erfindungsgemäßen Peptide können verwendet werden, um ein Diagnostikum herzustellen. Das erfindungsgemäße Diagnostikum ist dabei erhältlich durch an sich bekannte Immunisierung von Tieren mit mindestens einem der erfindungsgemäßen Peptide. Nach der Immunisierung kann aus den immunisierten Tieren eine Immunglobulin-Fraktion isoliert werden, die Antikörper-Fractionen enthält, welche einen Antikörper-Titer gegen mindestens eines der erfindungsgemäßen Peptide aufweisen. Die so erhaltenen Antikörpern sind ebenfalls Gegenstand der vorliegenden Erfindung. In einer alternativen Ausführungsform können neben den vollständigen Antikörpern bestehend aus F<sub>ab</sub> und F<sub>c</sub> auch deren Fragmente wie F<sub>ab</sub> oder Fragmente der Antikörper verwendet werden, welche die Idiotypen zu den Epitopen der Peptide sind.

Die Peptide gemäß der Erfindung sind zur Herstellung eines Mittels zur Diagnose von biologisch aktiven h-PTH (1-37) geeignet.

Die Erfindung wird anhand der folgenden Beispiele näher beschrieben:

#### Beispiel 1

#### Festphasensynthese der Peptide

Das erfindungsgemäße Verfahren zur Synthese der Peptide beruht auf der Peptidsynthese am festen Träger. Die C-terminale Aminosäure wird jeweils in Gegenwart von Dicyclohexylcarbodiimid und Dimethylaminopyridin an das Trägermaterial gebunden. Als Trägermaterial für die Synthesen werden Wang-Harz oder entsprechende Harze eingesetzt.

Folgende L-Aminosäure-Derivate werden für die Synthese der Sequenz, ausgehend vom aufgeführten Peptidyl-Harz, verwendet: a) hPTH 1-10: Fmoc-Asn(Trt)-Wang-Harz, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-Val(tBu)-OH. b) hPTH 9-18: Fmoc-Met-Wang-Harz, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH. c) hPTH 24-37: Fmoc-Leu-Wang-Harz, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

Die Synthese kann durch in situ-Aktivierung mit 2-(1H-Benzotriazol-1-yl)-1,1,3,3-tetramethyluroniumtetrafluorborat (TBTU) oder dessen Derivaten oder mit Benzotriazol-1-yl-oxytris-(dimethylamino)-phosphoniumhexafluorophosphat (BOP) oder dessen Derivaten in Gegenwart von Diisopropylethylamin oder N-Methylmorpholin und 1-Hydroxybenzotriazol durchgeführt werden, wobei während der Kupplungen in N,N-Dimethylformamid, N,N-Dimethylacetamid oder N-Methylpyrrolidon ein vier- bis zehnfacher Überschuß der Fmoc-L-Aminosäure verwendet wird. Die Abspaltungen der Fmoc-Gruppen werden mit 20% Piperidin oder 2% Piperidin und 2% 1,8-Diazbicyclo[5,4,0]undec-7-en (DBU) in N,N-Dimethylformamid, N,N-Dimethylacetamid oder N-Methylpyrrolidon durchgeführt. Nach der Synthese werden die Harze mit 2-Propanol und Dichlormethan gewaschen und im Hochvakuum bis zur Gewichtskonstanz getrocknet.

Zur Abspaltung vom Träger und Entblockierung wird das Peptidyl-Harz 30–90 Minuten bei Raumtemperatur mit Trifluoressigsäure, die 5% Scavenger, Wasser, Ethandiol, Phenol oder Thioanisol, enthält, umgesetzt, filtriert, mit Trifluoressigsäure gewaschen und anschließend mit tert-Butylmethylether ausgefällt. Der Niederschlag wird aus wäßriger Lösung lyophilisiert.

#### Beispiel 2

##### Reinigung und Analyse

Die Reinigung der Rohprodukte erfolgt chromatographisch über eine C18-Reverse-Phase-Säule (10 µm, Puffer A: 0,01 N HCl in Wasser; Puffer B: 20% Isopropanol, 30% Methanol, 50% Wasser, 0,01 N HCl; Gradient: 10–80% in 60 Minuten; Detektion 230 nm).

Reinheit der Produkte werden durch Massenspektrometrie und C18-Reverse-Phase-Chromatographie bestimmt.

#### Beispiel 3

##### Kopplung an Carrierprotein

Als Carrierprotein werden Hämocyanin, Thyroglobulin, Rinderserumalbumin, Ovalbumin oder Mauserumalbumin verwendet. Die Kopplung erfolgt nach der Carbodiimid Methode über Carboxylgruppen des Peptides. Das Peptid wird in wäßriger Lösung durch 5 minütige Umsetzung mit 1-Ethyl-3-(3-dimethylaminopropyl) carbodiimid Hydrochlorid aktiviert. Die Kopplung erfolgt durch Zugabe des aktivierten Peptides zu einer wäßrigen Lösung des Carriers. Das molare Verhältnis beträgt 1 Peptid auf 50 Aminosäuren des Carrierproteins. Die Umsetzung dauert 4 Stunden.

Die Reaktion wird durch Zugabe von Natriumacetat in einer Endkonzentration von 100 mM gestoppt. Man läßt eine Stunde inkubieren.

Die Abtrennung des Protein-Peptid Konjugates vom Peptid erfolgt durch wiederholte Dialyse gegen 100 mM Phosphatpuffer pH 7,2.

#### Beispiel 4

##### Synthese der Multiple Antigenic Peptides (MAP)

Die dreifache Lysin-Verzweigung wird erreicht, indem an C-terminales Alanin, gebunden an Wang-Harz, in drei Kupplungszyklen jeweils Fmoc-L-Lysin(Fmoc)-OH gebunden wird. Durch Abspaltung mit Piperidin werden danach acht freie Aminofunktionen erhalten, an denen die Sequenzen des humanen Parathormons nach obiger Beschreibung synthetisiert werden.

#### Beispiel 5

##### Immunisierung

Für die Erstimmunisierung werden pro kg Körpergewicht des zu immunisierenden Tieres 125 µg des Carrier-Peptid Konjugates bzw. MAP in 250 ml Wasser gelöst und mit 250 µl kompletten Freund'schen Adjuvans emulgiert. Die Emulsion wird über den Rücken verteilt in 10 Portionen s.c. appliziert.

Das Boostern erfolgt nach 2–4 Wochen analog. Hierbei wird lediglich das komplette Freund'sche Adjuvans durch inkomplettes Freund'sches Adjuvans ersetzt.

##### Patentansprüche

1. Peptide aus der Sequenz des hPTH (1-37) enthaltend α-helicale Aminosäuresequenzbereiche und/oder nicht strukturierte Aminosäuresequenzbereiche, wobei die Peptide bei Injektion in Tiere Antikörper zu induzieren vermögen.

2. Peptide nach Anspruch 1 aus hPTH (1-37) mit der Sequenz

hPTH 1-10 NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-Asn<sup>10</sup>-OH (1)

hPTH 1-9 NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-His<sup>9</sup>-OH (2)

hPTH 1-8 NH<sub>2</sub>-Ser<sup>1</sup>-Val<sup>2</sup>-Ser<sup>3</sup>-Glu<sup>4</sup>-Ile<sup>5</sup>-Gln<sup>6</sup>-Leu<sup>7</sup>-Met<sup>8</sup>-OH (3)

3. Peptide nach Anspruch 1 und/oder 2, die am N-terminalen Ende, in der Seitenkette und/oder am C-terminalen Ende modifiziert sind in Form von Acetylierungs-, Amidierungs-Phosphorylierungs- und/oder Glycosylierungsprodukten, und/oder gebunden sind an Carrierproteine wie Hämocyanin, Thyroglobulin, Rinderserumalbumin, Ovalalbumin oder Mausserumalbumin. 50
4. Diagnostikum, erhältlich durch an sich bekannte Immunisierung von Tieren mit mindestens einem der Peptide gemäß mindestens einem der Ansprüche 1 bis 3, Gewinnung von Immunoglobulinen enthaltenden Fraktionen aus den immunisierten Tieren und Isolierung von Fraktionen, die einen Antikörper-Titer gegen mindestens eines der Peptide gemäß mindestens einem der Ansprüche 1 bis 3 aufweisen und das gegebenenfalls weiter Hilfs- und/oder Trägerstoffe enthält. 55
5. Antikörper oder Fragmente von Antikörpern erhältlich durch Immunisierung von Tieren mit mindestens einem Peptid nach mindestens einem der Ansprüche 1 bis 3. 60
6. Verwendung der Peptide gemäß mindestens einem der Ansprüche 1 bis 3 zur Herstellung eines Mittels zur Diagnose von biologisch aktiven h-PTH (1-37). 65

## Peptide aus der Sequenz des hPTH (1-37)

Die vorliegende Erfindung betrifft Peptide aus der Sequenz  
5 des hPTH (1-37), ein Diagnostikum erhältlich durch Immunisierung von Tieren mit den Peptiden, Antikörper oder deren Fragmente erhältlich durch Immunisierung von Tieren mit den Peptiden sowie die Verwendung der Peptide zur Herstellung eines Mittels zur Diagnose von biologisch aktivem h-PTH.

10

Humanes Parathormon (hPTH), ein lineares Polypeptid aus 84 Aminosäuren, spielt eine wichtige Rolle in der Regulation des Calciumstoffwechsels. Der Metabolismus dieses Hormons führt zu einer großen Zahl C-terminaler Fragmente, deren  
15 biologische Funktion noch nicht geklärt ist. Als zirkulierendes N-terminales Fragment ist das hPTH 1-37 festgelegt (EP-A 0 349 545). Dieses Fragment besitzt die volle biologische Aktivität des Gesamthormons. Diese nimmt allerdings bei Verlust der ersten Aminosäure, Serin, deutlich ab und geht  
20 ohne die ersten beiden Aminosäuren, Serin und Valin, völlig verloren.

Für das intakte Hormon hPTH 1-84 und für das N-terminale Fragment werden Serumkonzentrationen im Bereich von  
25  $10^{-12}$  mol/l gemessen. Zur Bestimmung solch niedriger Konzentrationen bedient man sich immunologischer Meßverfahren. Die validesten Ergebnisse liefern hierbei Meßverfahren nach dem Doppelantikörper oder Sandwich Prinzip (z.B. Two-site Radioimmunoassay, IRMA oder Sandwich Enzym Linked Immuno  
30 Sorbent Assay, Sandwich ELISA). Solche Assays sind für hPTH 1-84 kommerziell erhältlich. Zur Messung von hPTH 1-34 ist ein Assay nach dem Doppelantikörper-Prinzip nicht bekannt.

35 Hierfür sind zwei Antikörper notwendig. Diese müssen, um eine gegenseitige sterische Hinderung zu vermeiden, Epitope des Antigens erkennen, die in ausreichender Entfernung zueinander liegen. Bei Immunisierung mit dem intakten Antigen erhält man ein heterogenes Gemisch unterschiedlicher Anti-

- 2 -

- körper, die für einen Sandwich-Assay erst aufwendig gereinigt werden müssen. Zwar war es bisher möglich aufgrund theoretischer Berechnungen nach B.A. Jameson & H. Wolf, The antigenic index: a novel algorithm for predicting antigenic determinants, CABIOS 4, p 181-186, 1988 am N-Terminus eine bevorzugte immunogen wirkende Sequenz im Bereich der Aminosäuren 7 - 14 festzustellen. Eine Immunisierung mit N-terminalen Fragmenten nach etablierten Methoden führt in erster Linie zu Antikörpern, die, wie für hPTH 1-34 beschrieben (J. Tampe, P. Brozio, H.E. Manneck, A. Mißbichler, E. Blind, K.B. Müller, H. Schmidt-Gayk und F.P. Armbruster; Characterisation of antibodies against human N-terminal parathyroid hormon by epitope mapping; J. Immunoassay 13 S. 1-13, 1992), in dem Bereich dieser Aminosäuren binden. Diese Antikörper können aber nicht zwischen biologisch aktiven und biologisch inaktiven PTH 1-84 oder Fragmenten davon, denen die ersten beiden Aminosäuren Serin und Valin fehlen, unterscheiden.
- 20 Das der Erfindung zugrunde liegende technische Problem besteht darin, Peptide anzugeben, mit deren Hilfe die oben genannten Nachteile der Diagnose von biologisch aktivem h-PTH beseitigt werden können.
- 25 Das angesprochene technische Problem wird überraschenderweise gelöst durch Peptide aus der Sequenz des hPTH (1-37) enthaltend  $\alpha$ -helicale Aminosäuresequenzbereiche und/oder nicht strukturierte Aminosäuresequenzbereiche, wobei die Peptide bei Injektion in Tiere Antikörper zu induzieren vermögen. Dabei enthalten die Peptide vorzugsweise die N-terminale  $\alpha$ -Helix im Bereich der Aminosäuren 5-9, einen unstrukturierten Abschnitt der Aminosäuren 10-16 und/oder eine C-terminale  $\alpha$ -Helix im Bereich der Aminosäuresequenz 17-34 des hPTH (1-37). Vorzugsweise werden die folgenden erfindungsgemäßen Peptide zur Immunisierung verwendet:

hPTH 24-29

hPTH 24-28

Die genannten Sequenzen repräsentieren in ihrer Primärstruktur wesentliche Merkmale der Sekundärstruktur, wie sich durch NMR-Daten unterstützend belegen läßt. Voraussetzung  
10 dazu war eine Festlegung der Sekundärstruktur für PTH 1-37 in physiologischer Lösung.

Die genannten strukturell auffälligen Bereiche wirken gut immunogen. Es werden Antikörper gebildet, die an den ersten  
15 Aminosäuren des N-Terminus binden. Bereits das Fehlen von zwei Aminosäuren führt zu einem erheblichen Affinitätsverlust. Da diese Aminosäuren zur Ausübung der biologischen Wirkung unerläßlich sind, ist es mit dem erfindungsgemäßen Peptid möglich Antikörper zu erhalten, die nur hPTH und  
20 Fragmente davon erkennen, die biologisch aktiv sind.

Weiterhin sind Antikörper herstellbar, die den midregionalen Bereich 9-15 detektieren, und Antikörper, die C-terminal im Bereich der Aminosäuren 30-37 binden. Erfindungsgemäß können  
25 also Antikörper gegen Bereiche des hPTH 1-37 produziert werden, die aufgrund theoretischer Berechnungen im Gesamtmolekül nicht immunogen wirken. Diese Bereiche liegen zudem so weit auseinander, daß keine sterische Hinderung vorliegt, die ein gleichzeitiges Binden zweier Antikörper verhindern  
30 würde.

Die Peptide können in bevorzugten Ausführungsformen am N-terminalen Ende, in der Seitenkette und/oder am C-terminalen Ende modifiziert sein, und zwar in Form von Acetylierungs-,  
35 Amidierungs-, Phosphorylierungs- und/oder Glycosylierungsprodukten.

- 7 -

Schließlich können erfindungsgemäße Peptide auch an Carrierproteine wie Hämocyanin, Thyroglobulin, Rinderserumalbumin, Ovalalbumin oder Mausserumalbumin etc. gebunden sein. Die Bindung an die Carrierproteine erfolgt vorzugsweise durch  
5 Carbodiimid oder Formaldehyd.

Die erfindungsgemäßen Peptide können verwendet werden, um ein Diagnostikum herzustellen. Das erfindungsgemäße Diagnostikum ist dabei erhältlich durch an sich bekannte Immunisierung von Tieren mit mindestens einem der erfindungsgemäßen Peptide. Nach der Immunisierung kann aus den immunisierten Tieren eine Immunoglobulin-Fraktion isoliert werden, die Antikörper-Fractionen enthält, welche einen Antikörper-Titer gegen mindestens eines der erfindungsgemäßen Peptide aufweisen. Die so erhaltenen Antikörpern sind ebenfalls Gegenstand der vorliegenden Erfindung. In einer alternativen Ausführungsform können neben den vollständigen Antikörpern bestehend aus  $F_{ab}$  und  $F_c$  auch deren Fragmente wie  $F_{ab}$  oder Fragmente der Antikörper verwendet werden, welche die Idiotypen zu den Epitopen der Peptide sind.  
10  
15  
20

Die Peptide gemäß der Erfindung sind zur Herstellung eines Mittels zur Diagnose von biologisch aktiven h-PTH (1-37) geeignet.  
25

Die Erfindung wird anhand der folgenden Beispiele näher beschrieben:

#### Beispiel 1

##### Festphasensynthese der Peptide:

Das erfindungsgemäße Verfahren zur Synthese der Peptide beruht auf der Peptidsynthese am festen Träger. Die C-terminale Aminosäure wird jeweils in Gegenwart von Dicyclohexylcarbodiimid und Dimethylaminopyridin an das Trägermaterial gebunden. Als Trägermaterial für die Synthesen werden Wang-  
30  
35

- 8 -

Harz oder entsprechende Harze eingesetzt.

Folgende L-Aminosäure-Derivate werden für die Synthese der Sequenz, ausgehend vom aufgeführten Peptidyl-Harz, verwendet: a) hPTH 1-10: Fmoc-Asn(Trt)-Wang-Harz, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-Ser(tBu)-OH. b) hPTH 9-18: Fmoc-Met-Wang-Harz, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH. c) hPTH 24-37: Fmoc-Leu-Wang-Harz, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

Die Synthese kann durch in situ-Aktivierung mit 2-(1H-Benzotriazol-1-yl)-1,1,3,3,-tetramethyluroniumtetrafluoroborat (TBTU) oder dessen Derivaten oder mit Benzotriazol-1-yl-oxy-tris-(dimethylamino)-phosphoniumhexafluorophosphat (BOP) oder dessen Derivaten in Gegenwart von Diisopropylethylamin oder N-Methylmorpholin und 1-Hydroxybenzotriazol durchgeführt werden, wobei während der Kupplungen in N,N-Dimethylformamid, N,N-Dimethylacetamid oder N-Methylpyrrolidon ein vier- bis zehnfacher Überschuß der Fmoc-L-Aminosäure verwendet wird. Die Abspaltungen der Fmoc-Gruppen werden mit 20% Piperidin oder 2% Piperidin und 2% 1,8-Diazbicyclo[5,4,0]undec-7-en (DBU) in N,N-Dimethylformamid, N,N-Dimethylacetamid oder N-Methylpyrrolidon durchgeführt. Nach der Synthese werden die Harze mit 2-Propanol und Dichlormethan gewaschen und im Hochvakuum bis zur Gewichtskonstanz getrocknet.

Zur Abspaltung vom Träger und Entblockierung wird das Peptidyl-Harz 30-90 Minuten bei Raumtemperatur mit Trifluoressigsäure, die 5% Scavenger, Wasser, Ethandiol, Phenol oder Thioanisol, enthält, umgesetzt, filtriert, mit Trifluoressigsäure gewaschen und anschließend mit tert-Butylmethylet-

- 9 -

her ausgefällt. Der Niederschlag wird aus wäßriger Lösung lyophilisiert.

5

## Beispiel 2

### Reinigung und Analyse

10 Die Reinigung der Rohprodukte erfolgt chromatographisch über eine C18-Reverse-Phase-Säule (10µm, Puffer A: 0,01 N HCl in Wasser; Puffer B: 20% Isopropanol, 30 % Methanol, 50% Wasser, 0,01 N HCl; Gradient: 10-80% in 60 Minuten; Detektion 230 nm).

15

Die Reinheit der Produkte wird durch Massenspektrometrie und C18-Reverse-Phase-Chromatographie bestimmt.

## 20 Beispiel 3

### Kopplung an Carrierprotein

Als Carrierprotein werden Hämocyanin, Thyroglobulin, Rinder-serumalbumin, Ovalbumin oder Mausserumalbumin verwendet. Die  
25 Kopplung erfolgt nach der Carbodiimid-Methode über Carboxylgruppen des Peptides. Das Peptid wird in wässriger Lösung durch 5 minütige Umsetzung mit 1-Ethyl-3-(3-dimethylamino-propyl) carbodiimid-Hydrochlorid aktiviert. Die Kopplung  
30 erfolgt durch Zugabe des aktivierten Peptides zu einer wässrigen Lösung des Carriers. Das molare Verhältnis beträgt 1 Peptid auf 50 Aminosäuren des Carrierproteins. Die Umsetzung dauert 4 Stunden.

Die Reaktion wird durch Zugabe von Natriumacetat in einer  
35 Endkonzentration von 100 mM gestoppt. Man läßt eine Stunde inkubieren.

- 10 -

Die Abtrennung des Protein-Peptid Konjugates vom Peptid erfolgt durch wiederholte Dialyse gegen 100 mM Phosphatpuffer pH 7,2.

5

#### Beispiel 4

##### Synthese der Multiple Antigenic Peptides (MAP)

- 10 Die dreifache Lysin-Verzweigung wird erreicht, indem an C-terminales Alanin , gebunden an Wang-Harz, in drei Kupplungszyklen jeweils Fmoc-L-Lysin(Fmoc)-OH gebunden wird. Durch Abspaltung mit Piperidin werden danach acht freie Aminofunktionen erhalten; an denen die Sequenzen des humanen
- 15 Parathormons nach obiger Beschreibung synthetisiert werden.

#### Beispiel 5

##### 20 Immunisierung

- Für die Erstimmunisierung werden pro kg Körpergewicht des zu immunisierenden Tieres 125 µg des Carrier-Peptid Konjugates bzw. MAP in 250 ml Wasser gelöst und mit 250 µl kompletten
- 25 Freund'schen Adjuvans emulgiert. Die Emulsion wird über den Rücken verteilt in 10 Portionen s.c. appliziert.

- Das Boostern erfolgt nach 2-4 Wochen analog. Hierbei wird lediglich das komplette Freund'sche Adjuvans durch inkomplettes Freund'sches Adjuvans ersetzt.
- 30

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

\* Special categories of cited documents:

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \*A\* document member of the same patent family

## [57] ABSTRACT

The present invention is directed to peptides from the sequence of hPTH(1-37), which contain  $\alpha$ -helical amino acid sequence regions and/or non-structured amino acid sequence regions, said peptides being capable of inducing antibodies when injected into animals. Furthermore, the invention is directed to a diagnostic agent and antibodies obtainable by immunizing animals using the peptides according to the invention.

# ANTIBODIES THAT BIND PEPTIDES FROM THE hPTH SEQUENCE (1-37)

This application was filed under 35 U.S.C. § 371 and claims priority from PCT/EP95/03757, filed Sep. 22, 1995.

The present invention relates to peptides from the sequence of hPTH(1-37), and the use of said peptides in the preparation of an agent for diagnosing biologically active hPTH.

Human parathyroid hormone (hPTH), a linear polypeptide having 84 amino acids, plays an important role in the regulation of the calcium metabolism. The metabolism of this hormone gives rise to a large number of C-terminal fragments, the biological functions of which have not yet been elucidated. The hPTH(1-37) has been established as a circulating N-terminal fragment (EP-A 0 349 545). This fragment has the full biological activity of the entire hormone. However, upon loss of the first amino acid, serine, the activity significantly decreases and is lost completely without the first two amino acids, serine and valine.

Serum levels in the range of  $10^{-12}$  mol/l are measured for the intact hormone hPTH(1-84) and for the N-terminal fragment. Immunological measuring procedures are employed to determine such low concentrations. Here, the most valid results are provided by measuring procedures according to the double antibody or sandwich principle (e.g., the two-site radioimmunoassay, IRMA, or the sandwich enzyme-linked immuno sorbent assay, Sandwich ELISA). For hPTH(1-84), such assays are commercially available. For the measurement of hPTH(1-34), an assay according to the double antibody principle is not known.

Here, two antibodies are required. In order to avoid mutual steric hindrance, they must be capable of recognizing antigen epitopes located at a sufficient distance from each other. When immunizing using the intact antigen, a heterogeneous mixture of various antibodies is obtained, which first must be subjected to an expensive purification in order to conduct a sandwich assay. According to theoretical calculations by B. A. Jameson and H. Wolf, The Antigenic Index: A Novel Algorithm for Predicting Antigenic Determinants, CABIOS 4, p. 181-186, 1988; it has been possible so far to detect a preferred sequence having immunogenic activity in the region of the amino acids 7-14 at the N-terminus. Immunization with N-terminal fragments according to established methods predominantly results in antibodies which, as has been described for hPTH(1-34) (J. Tampe, P. Brozio, H. E. Manneck, A. Mißbichler, E. Blind, K. B. Millers, H. SchmidtGayk, and F. P. Armbruster, Characterisation of Antibodies Against Human N-Terminal Parathyroid Hormone by Epitope Mapping; J. Immunoassay 13, p. 1-13, 1992), bind in the region of these amino acids. However, these antibodies are not capable of discriminating between biologically active and biologically inactive PTH (1-84) or fragments thereof lacking the first two amino acids serine and valine.

The technical problem which this invention is based upon is to provide peptides by means of which it is possible to eliminate the above-mentioned drawbacks in the diagnosis of biologically active hPTH.

Surprisingly, the technical problem described above is solved by means of the following peptides from the sequence of hPTH(1-37):

The indicated sequences represent essential features of the secondary structure in their primary structure, as can be demonstrated by supporting NMR data. One precondition to this end was a determination of the PTH(1-37) secondary structure in physiological solution.

The above-mentioned regions of conspicuous structure have good immunogenic activity. Antibodies are formed, binding to the first amino acids of the N-terminus. Deficiency of only two amino acids gives rise to a substantial loss in affinity. Because these amino acids are indispensable

for the biological activity to arise, it is possible by using the peptides of the invention to obtain antibodies recognizing only hPTH and fragments thereof which are biologically active.

Furthermore, antibodies can be produced which detect the mid-region 9-15, as well as antibodies giving C-terminal binding in the region of the amino acids 30-37. According to the invention, it is therefore possible to produce antibodies against hPTH(1-37) regions which, according to theoretical calculations, do not exhibit immunogenic activity within the entire molecule. In addition, these regions are separated from each other by such a far distance that no steric hindrance is present which would prevent simultaneous binding of two antibodies.

In preferred embodiments, the peptides may be modified at the N-terminal end, in the side-chain and/or at the C-terminal end, namely, taking the form of acetylation, amidation, phosphorylation and/or glycosylation products.

Eventually, the peptides of the invention may also be bound to carrier proteins such as hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin, or mouse serum albumin etc. Binding to the carrier proteins is preferably effected using carbodiimide or formaldehyde.

The peptides of the invention may be used in the preparation of a diagnostic agent. The diagnostic agent of the invention can be obtained using the per se known immunization of animals with at least one of the peptides according to the invention. Following immunization, an immunoglobulin fraction can be isolated from the immunized animals, which contains antibody fractions having an antibody titer against at least one of the peptides of the invention. The invention is also directed to the antibodies thus obtained. In addition to the complete antibodies consisting of F<sub>ab</sub> and F<sub>c</sub>, fragments thereof such as F<sub>ab</sub> or fragments of the antibodies being idiotypes of peptide epitopes may also be used in an alternative embodiment.

The peptides according to the invention are suitable for preparing an agent for the diagnosis of biologically active hPTH(1-37).

Referring to the following examples, the invention will be described in more detail.

#### EXAMPLE 1

##### Solid-Phase Synthesis of Peptides

The method of the invention for synthesizing the peptides is based on the peptide synthesis using a solid support. Each of the C-terminal amino acids is bound to the support material in the presence of dicyclohexylcarbodiimide and dimethylaminopyridine. Wang resin or similar resins are used as support material for the syntheses.

The following derivatives of L-amino acids are used in the synthesis of the sequence, starting from the peptidyl resin as specified: a) hPTH(1-10) Seq. I.D. No. 1: Fmoc-Asn(Trt)-Wang resin, Fmoc-His(Trt)-OH, Fmoc-Met-OH, Fmoc-Leu-OH, Fmoc-Gln(Trt)-OH, Fmoc-Ile-OH, Fmoc-Glu(OtBu)-OH, Fmoc-Ser(tBu)-OH, Fmoc-Val-OH, Boc-

Ser(tBu)-OH; b) hPTH(9-18) Seq. I.D. No. 7: Fmoc-Met-Wang resin, Fmoc-Ser(tBu)-OH, Fmoc-Asn(Trt)-OH, Fmoc-Leu-OH, Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Gly-OH, Fmoc-Leu-OH, Fmoc-Asn(Trt)-OH, Boc-His(Trt)-OH; c) hPTH(24-37) Seq. I.D. No. 18: Fmoc-Leu-Wang resin, Fmoc-Ala-OH, Fmoc-Val-OH, Fmoc-Phe-OH, Fmoc-Asn(Trt)-OH, Fmoc-His(Trt)-OH, Fmoc-Val-OH, Fmoc-Asp(OtBu)-OH, Fmoc-Gln(Trt)-OH, Fmoc-Leu-OH, Fmoc-Lys(Boc)-OH, Fmoc-Lys(Boc)-OH, Fmoc-Arg(Pmc)-OH, Fmoc-Leu-OH.

The synthesis may be carried out by in situ activation using 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate (TBTU) or derivatives thereof, or benzotriazol-1-yloxy-tris(dimethylamino)phosphonium hexafluorophosphate (BOP) or derivatives thereof in the presence of diisopropylethylamine or N-methylmorpholine and 1-hydroxybenzotriazole, using a four- to tenfold excess of Fmoc-L-amino acid during the coupling reactions in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. Removal of the Fmoc groups is effected using 20% piperidine or 2% piperidine and 2% 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidone. Following synthesis, the resins are washed with 2-propanol and dichloromethane and dried to constant weight in a high vacuum.

Removal from the support and deprotection are carried out by reacting the peptidyl resin with trifluoroacetic acid containing 5% scavenger, water, ethanediol, phenol or thioanisole for 30-90 minutes at room temperature, filtrating, washing with trifluoroacetic acid, and subsequently precipitating with tert-butyl methyl ether. The precipitate is lyophilized from aqueous solution.

#### EXAMPLE 2

##### Purification and Analysis

The raw products are purified by chromatography on a C18 reversed phase column (10  $\mu$ m, buffer A: 0.01 N HCl in water; buffer B: 20% isopropanol, 30% methanol, 50% water, 0.01 N HCl; gradient: 10-80% within 60 minutes; detection at 230 nm).

The purity of the products is determined using mass spectrometry and C18 reversed phase chromatography.

#### EXAMPLE 3

##### Coupling to Carrier Protein

Used as carrier proteins are hemocyanin, thyroglobulin, bovine serum albumin, ovalbumin, or mouse serum albumin. Coupling is performed according to the carbodiimide method by way of the carboxyl groups of the peptides. The peptide is activated in aqueous solution by reaction with 1-ethyl-3-(3-methylaminopropyl)carbodiimide hydrochloride for 5 minutes. Coupling is effected by adding the activated peptide to an aqueous solution of the carrier. The molar ratio is 1 peptide 50 amino acids of the carrier protein. The reaction takes 4 hours.

We claim:

1. A kit for detecting active human parathyroid hormone (hPTH) comprising a container and a first group of antibodies or antibody fragments and a second group of antibodies or antibody fragments, wherein the first group selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 1-6 and the second group selectively binds hPTH at an epitope contained within amino acids 24 to 37.
2. The kit of claim 1, wherein the second group of antibodies or antibody fragments selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 18-36.
3. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 1.
4. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 2.
5. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 3.
6. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 4.
7. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 5.
8. The kit of claim 1, wherein the first group of antibodies or antibody fragments selectively bind peptides of hPTH having SEQ. ID. No. 6.
9. An immunological method of detecting active human parathyroid hormone (hPTH) in a sample comprising:
  - contacting the sample with a first antibody or antibody fragment which selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 1-6, wherein the first antibody or antibody fragment binds hPTH in the sample;
  - contacting the sample with a second antibody or antibody fragment which selectively binds hPTH at an epitope contained within amino acids 24 to 37; wherein the second antibody or antibody fragment binds to hPTH bound by the first antibody or antibody fragment; and
  - detecting the binding of the first and second antibodies or antibody fragments, wherein the binding of the first and second antibodies or antibody fragments indicates the presence of active hPTH in the sample.
10. The method of claim 9, wherein the second antibody or antibody fragment selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 18-36.
11. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 1.
12. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 2.
13. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 3.
14. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 4.
15. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 5.
16. The method of claim 9, wherein the first antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 6.
17. A composition comprising an antibody or antibody fragment and a suitable carrier, wherein the antibody or antibody fragment selectively binds a peptide of human parathyroid hormone (hPTH) selected from the group consisting of peptides having SEQ. ID. Nos. 1-6.
18. The composition of claim 17, wherein the composition further comprises a second antibody or antibody fragment, wherein the second antibody or antibody fragment selectively binds hPTH at an epitope contained within amino acids 24 to 37.
19. The composition of claim 17, wherein the second antibody or antibody fragment selectively binds a peptide of hPTH selected from the group consisting of peptides having SEQ. ID. Nos. 18-36.
20. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 1.
21. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 2.
22. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 3.
23. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 4.
24. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 5.
25. The composition of claim 17, wherein the antibody or antibody fragment selectively binds peptides of hPTH having SEQ. ID. No. 6.

ANSWER AND COUNTERCLAIMS OF  
DEFENDANTS SCANTIBODIES  
CLINICAL LABORATORY, INC. AND  
SCANTIBODIES LABORATORY, INC.

20  
21 Defendants Scantibodies Clinical Laboratory, Inc. and Scantibodies Laboratory, Inc.  
22 (collectively "Scantibodies") answer the Complaint for Patent Infringement of Nichols  
23 Institute Diagnostics, Inc. ("Nichols") as follows:

24 **JURISDICTION AND VENUE**

25 1. Scantibodies admits that the district court has subject matter jurisdiction over  
26 patent infringement actions, and that the Complaint attempts to set forth a claim for patent  
27 infringement.  
28

2. Scantibodies admits that venue is proper in this jurisdiction for a properly pleaded patent infringement action against Scantibodies in that Scantibodies' principal place of business is located in this district and that Scantibodies conducts business in this district. Scantibodies denies each and every remaining allegation of paragraph 2 and further denies that it has committed any infringing acts within the district, or anywhere, as alleged in the Complaint.

**PARTIES**

3. On information and belief, Scantibodies admits the allegations of paragraph 3.

4. Scantibodies admits the allegations of paragraph 4.

5. Scantibodies admits the allegations of paragraph 5.

## FIRST CLAIM

6. In response to paragraph 6, Scantibodies incorporates and realleges the above responses to paragraphs 1-5.

7. Scantibodies lacks the knowledge or information sufficient to form a belief as to the truth of the allegations of paragraph 7 and, therefore, denies each and every allegation contained therein. Scantibodies admits that Exhibit 1 purports to be a copy of U.S. Patent No. 6, 030, 790.

8. Scantibodies lacks the knowledge or information sufficient to form a belief as to the truth of the allegations of paragraph 8 and, therefore, denies each and every allegation contained therein.

9. Scantibodies denies each and every allegation contained in paragraph 9.

10. Scantibodies denies each and every allegation contained in paragraph 10.

11. Scantibodies denies each and every allegation contained in paragraph 11.

12. Scantibodies denies each and every allegation contained in paragraph 12.

13. Scantibodies denies each and every allegation contained in paragraph 13.

///

///

///

1 **AFFIRMATIVE DEFENSES**

2 Based on the facts presently available to it, Scantibodies alleges the following  
3 affirmative defenses:

4 **FIRST AFFIRMATIVE DEFENSE**

5 (Failure to State a Claim)

6 14. The Complaint fails to state a claim upon which relief may be granted.

7 **SECOND AFFIRMATIVE DEFENSE**

8 (Laches/Estoppel/Waiver)

9 15. Nichols' Complaint, and any claims for damages alleged therein, are barred in  
10 whole or in part by the equitable doctrine of laches, estoppel and/or waiver.

11 **THIRD AFFIRMATIVE DEFENSE**

12 (Patent Invalidity: Anticipation/Obviousness)

13 16. Each of the claims of U.S. Patent No. 6, 030, 790 ("the '790 patent") is  
14 invalid on the grounds that the purported inventions attempted to be patented are invalid as  
15 anticipated under 35 U.S.C. § 102, or invalid as obvious under 35 U.S.C. § 103, or both.

16 **FOURTH AFFIRMATIVE DEFENSE**

17 (Estoppel)

18 17. By reason of the proceedings in the United States Patent Office, including the  
19 prosecution of the application which resulted in the '790 patent and related applications, and  
20 by reason of the elections, positions, concessions, representations, and statements therein  
21 taken or made by or on behalf of the applicant for such patents, Nichols is estopped from  
22 construing the claims of the patents at issue, even if this were otherwise possible, to cover  
23 and include any acts by Scantibodies.

24 **FIFTH AFFIRMATIVE DEFENSE**

25 (Patent Invalidity: Prior Invention)

26 18. Each of the claims of the patent in suit is invalid under 35 U.S.C. §§ 102(f)  
27 and 102(g).

(3) withheld from the PTO the best mode for carrying out the invention known to the inventors at the time the application for the '790 patent was filed; (4) withheld enabling information known to the applicants at the time the application was filed; and (5) failed to identify the correct inventors of the claimed inventions of the '790 patent to the PTO.

Failure to Disclose the Tampe, et al. Reference

24. The application for the '790 patent is entitled to a priority date in the United States of no earlier than September 22, 1995, the filing date of the PCT Application under 35 U.S.C. § 102(b). On information and belief, at the time they filed the application for the '790 patent, the inventors and their attorneys were aware of an article entitled "Characterization of Antibodies Against Human N-Terminal Parathyroid Hormone by Epitope Mapping" published in *Journal of Immunoassay* 13(1) 1-13 (1992), by Jens Tampe, et al. The article, which was published in 1992, is § 102(b) prior art to the '790 patent.

25. The inventors and their attorneys were aware of the Tampe article and its materiality, as they included it in the background discussion of the '790 patent specification. The article was clearly material to the patentability of the claimed inventions, as the PTO Examiner cited it as the bases for rejecting all pending claims in an August 13, 1998 office action.

26. Neither the inventors nor their agents filed an Information Disclosure Statement ("IDS"), or a PTO Form 1449, with the PTO at any time during the prosecution of the application that issued as the '790 patent. As a result, the inventors and their attorneys never disclosed the content of the Tampe article to the PTO in connection with the examination of the application for the '790 patent.

27. That failure constitutes a breach of the inventors' duty, pursuant to Rule 56, to disclose to the PTO information available to them which is material to the patentability of the application.

///

///

///

1           Misrepresentations to the PTO About the Tampe Reference

2           28.     During the prosecution of the '790 patent, the PTO Examiner issued an office  
3     action on August 13, 1998, in which she rejected the pending claims of the application in  
4     light of the Tampe *et al.* reference.

5           29.     Applicants, through their attorneys, responded to the office action on  
6     December 14, 1998. On pages 8-9 of their response, Applicants wrote: "Applicant  
7     respectfully submit that Tampe *et al* fail to teach antibodies and antibody fragments which  
8     selectively bind to active hPTH or antibodies and antibody fragments that are capable of  
9     binding to the N-terminus of hPTH." On that basis, Applicants misrepresented that Tampe *et*  
10    *al* "fail to teach each element in the currently pending claims."

11          30.     Applicants further misrepresented the teachings in Tampe *et al* in the  
12    background discussion of the '790 patent. In Column 2, lines 21-24, of the patent,  
13    Applicants, through their attorneys, included the following statement about the Tampe  
14    reference in the original application to the PTO: "However, these antibodies are not capable  
15    of discriminating between biologically active and biologically inactive PTH (1-84) or  
16    fragments thereof lacking the first two amino acids serine and valine."

17          31.     Both the office action response and the discussion in the specification  
18    constitute misrepresentations of the Tampe reference. The Tampe *et al* reference clearly  
19    teaches antibodies and antibody fragments capable of selectively binding to the N-terminus  
20    of hPTH.

21          32.     On information and belief, the Applicants and their attorneys were aware of  
22    this teaching in the Tampe reference.

23          33.     On information and belief, the misrepresentations contained in the office  
24    action response dated December 14, 1998 were made with an intent to deceive the PTO. The  
25    misrepresentations were highly material, since they opposed an argument of unpatentability  
26    from the PTO.

27    ///

28    ///

Concealing Material Information Related to Enablement  
and the Best Mode For Carrying Out the Claimed Invention

34. In their own 1998 article (prior to the issuance of the '790 patent) entitled "Production of Sequence Specific Polyclonal Antibodies to Human Parathyroid Hormone 1-37 by Immunization With Multiple Antigenic Peptides," Applicants discussed the generation of site-specific antibodies to the N-terminus of hPTH peptide, e.g., hPTH 1-10, by incorporating certain amino acid residues and using "multiple antigenic peptide systems (MAP) for immunization." The article discussed the failure of other techniques, such as those disclosed and claimed in the '790 patent, to generate site-specific antibodies to the N-terminus of hPTH.

35. Neither the Applicants nor their attorneys ever disclosed Applicants' 1998 article to the PTO Examiner.

36. In their 1998 article, Applicants referred to their own prior work using the MAP technique, as disclosed in their own 1994 article. The 1994 article, written by Applicants, pre-dates the September 22, 1995 filing date for the application underlying the '790 patent.

37. Neither the Applicants nor their attorneys ever disclosed use of the MAP technique for generating site-specific antibodies to the N-terminus of hPTH, the purported invention claimed by the '790 patent to the PTO.

38. Applicants knew of the MAP technique to generate site-specific antibodies to the N-terminus of hPTH at least as early as September 22, 1995, the filing date of the PCT Application (WO 96/10041). Applicants disclosed the MAP technique in the specification of the PCT Application, as well as in the European Patent Application (EP 0 783 522 B1) that was filed simultaneously with the application in the United States for the '790 patent. Both the '790 patent and the European patent application claimed priority from the PCT application. At the time they filed their application for the '790 patent in the United States, Applicants knew of the MAP technique and knew it was the best mode for carrying out their

1 claimed invention. However, Applicants failed to disclose the MAP technique to the PTO in  
2 connection with the application for the '790 patent.

3 Concealing Identity of the True Inventors from the PTO

4 39. On information and belief, applicants for the '790 patent concealed from the  
5 PTO the true identity of all the correct inventors of the invention claimed in the patent.

6 40. Scantibodies is informed and believes, and on that basis alleges, that Wolf-  
7 Georg Forssmann and others made inventive contributions to the '790 patent.

8 41. Forssmann was listed as an inventor on the PCT Application (WO 96/10041)  
9 and the European Patent Application (EP 0 783 522 B1) that relate to the subject matter  
10 disclosed and claimed in the '790 patent. Forssmann also was listed as an inventor on the  
11 1994 German Patent Application (P 44 34 551). That application is the purported basis of  
12 the foreign application priority date for the '790 patent. The PCT Application and the  
13 European Patent Application also both claimed priority from German Application No. P 44  
14 34 551.

15 42. On information and belief, applicants, their attorneys, and others substantially  
16 involved in the prosecution of the '790 patent, were aware of the identity of the correct  
17 inventors.

18 43. Applicants, their attorneys, and others substantially involved in the  
19 prosecution of the '790 patent never disclosed to the PTO the identity of the correct  
20 inventors.

21 44. On information and belief, the failure to identify the correct inventors of the  
22 '790 patent was done with an intent to deceive the PTO. The information related to the  
23 identity of the correct inventors was highly material to the PTO.

24 EIGHTH AFFIRMATIVE DEFENSE

25 (Inventorship)

26 45. Each of the claims of the '790 patent is invalid under 35 U.S.C. §§ 102(f), 111  
27 and 116 for failure to name all of the correct inventors.

28 ///

1 **COUNTERCLAIMS**

2 By way of counterclaims against Nichols, Scantibodies alleges as follows:

3 **JURISDICTION AND VENUE**

4 46. This Court has jurisdiction over this matter pursuant to 28 U.S.C. §§ 1331 and  
5 1338(a), because this is an action arising under the federal patent laws as to which the district  
6 courts have original jurisdiction. Venue is proper in this district pursuant to 28 U.S.C. §  
7 1391(b) because the defendant resides in this judicial district.

8 47. This Court has original jurisdiction of the Second Counterclaim under 28  
9 U.S.C. § 1338(b) because the Second Counterclaim is an unfair competition claim joined  
10 with a substantial and related claim under the patent laws of the United States. This Court  
11 has supplemental jurisdiction of the Second Counterclaim under 28 U.S.C. § 1367 because it  
12 is so related to Nichols' federal claim that it forms a part of the same case or controversy  
13 under Article III of the United States Constitution.

14 48. The defendant-counterplaintiffs, Scantibodies Clinical Laboratory, Inc. and  
15 Scantibodies Laboratory, Inc. (collectively "SCL") are corporations organized and existing  
16 under California law, having principal place of business in Santee, California.

17 49. On information and belief, the plaintiff-counterdefendant Nichols Institute  
18 Diagnostics, Inc. ("Nichols") is a corporation organized and existing under California law  
19 and has its principal place of business in San Juan Capistrano, California.

20 **STATEMENT OF THE CASE**

21 50. The counterclaims asserted herein are predicated on Nichols' anticompetitive,  
22 exclusionary and unfair conduct. Nichols is engaging in unfair competition in violation of  
23 California Business and Professions Code Section 17200 *et seq.*

24 **PTH TEST KIT INDUSTRY AND MARKET**

25 51. Parathyroid hormone (PTH) is an 84 amino acid peptide. It is a major factor  
26 in the calcium metabolism of the human body. The measurement of PTH in plasma has been  
27 central to laboratory investigation of patients with calcium metabolism disorders.

52. Generation of site-specific antibodies to the N-terminal bioactive fragment of PTH is key to the development of assays for measurement of PTH.

53. Due to the importance of detecting accurate levels of PTH in patients, such as kidney dialysis patients, a market has developed for these PTH assays and PTH test kits.

54. A domestic market for these PTH test kits has developed in the United States. The market continues to grow every year. Worldwide sales of PTH test kits in 2000 totaled approximately \$30 million. In 2001, that amount increased to approximately \$33 million.

55. Nichols is the largest producer of PTH test kits in the United States for the kidney dialysis patient testing market. In 2001, Nichols had approximately 75 % of the kidney dialysis patient testing market share in the United States. Behind Nichols, the next largest market shares for the PTH test kit market belonged to the following vendors: Diagnostic Products Corporation (DPC), DiaSorin, and Diagnostic Systems Laboratory (DSL). Scantibodies has been and continues to be a participant in the PTH test kit and lab services market in the United States.

56. Nichols has monopoly and/or market power in the PTH test kit market in the United States for kidney dialysis patient testing. Scantibodies is informed and believes, and on that basis alleges, that Nichols controls approximately 75 % or more of the PTH test kit market in the United States for kidney dialysis patient testing.

#### **FDA REGULATIONS GOVERNING PTH TESTING**

57. The extensive regulation by the FDA of medical devices includes the regulation of "in vitro diagnostic products." See 21 CFR § 801.119. Test kits for PTH levels in serum and plasma (processed human blood) fall within the definition of "in vitro diagnostic products" subject to FDA regulation as set forth in 21 CFR § 809.3. The applicable federal regulations classify test kits for PTH levels in humans as class two clinical chemistry and clinical toxicology devices pursuant to 21 CFR § 862.1545.

58. As class two in vitro diagnostic products, all test kits for PTH are subject to the FDA requirements for premarket notification in 21 CFR § 807.81, *et seq.*, and labeling in 21 CFR § 809.10. The premarket notification requirement mandates that all PTH test kit

1 manufactures provide premarket notification to FDA before introducing PTH test kits into  
2 interstate commerce. The labeling requirement mandates that every PTH test contain a label  
3 (or manufacturer's instructions or package insert) that includes, among other things,  
4 "[r]ecommended storage, handling or shipping instructions for the protection and  
5 maintenance of stability of the specimen" to be tested. 21 CFR § 809.10(b)(7)(iv). The  
6 manufacturer's instructions or package insert is submitted to the FDA as part of the  
7 premarket notification process.

8         59. Laboratories that use the NICHOLS PTH test kits are required to ensure that  
9 certain quality controls are maintained in the use of PTH test kits subject to FDA regulation  
10 pursuant to 42 CFR § 493 *et seq.* These quality control requirements mandate that, prior to  
11 reporting patient test results, the laboratories must either: (1) follow the PTH test kit  
12 manufacturer's instructions or package insert under 42 CFR § 493.1202(c); or (2) for each  
13 method that deviates from the manufacturer's instruction or package insert, comply with 42  
14 CFR § § 493.1201 through 493.1221, including verifying and establishing the accuracy,  
15 precision, analytical sensitivity, analytical specificity, reportable range of patient test results,  
16 reference ranges and any other performance characteristics required for test performance  
17 under 42 CFR § 493.1213; establishing calibration and calibration verification procedures for  
18 patient testing under 42 CFR § 493.1217, establishing control procedures under 42 CFR  
19 § 493.1218; and maintaining documentation of the verification or establishment of all  
20 applicable test performance specifications and quality control activities under CFR §  
21 493.1213(c) and 42 CFR § 493.1221. On information and belief, no laboratory that uses the  
22 NICHOLS PTH test kit has complied with the requirements of 42 CFR § § 493.1201 through  
23 493.1221 as required to entitle it to modify the NICHOLS' manufacturer's instructions when  
24 using the NICHOLS PTH test kit.

25         60. A manufacturer of a PTH test kit, such as NICHOLS, is required when it  
26 knows, or has knowledge of facts that would give it notice, that its PTH test kit is to be used  
27 for conditions, purposes, or uses other than the ones for which the test kit was offered when  
28

1 the manufacturer sold it, to re-label the test kit for the new intended use pursuant to 21 CFR §  
2 801.4.

3 **THE NICHOLS MANUFACTURER'S INSTRUCTIONS OR PACKAGE INSERT**

4 61. NICHOLS has submitted to the FDA, on at least three occasions (the most  
5 recent in December 2001), a premarket notification for a PTH test kit pursuant to Section  
6 510(k) of the Federal Food, Drug and Cosmetic Act. For each of these premarket  
7 notifications, NICHOLS submitted to the FDA its manufacturer's instructions or package  
8 insert for its PTH test kit that is distributed to NICHOLS customers to comply with the  
9 labeling requirements of 21 CFR § 809.10.

10 62. The NICHOLS' manufacturer's instructions or package insert requires that  
11 whole blood samples drawn from dialysis patients for PTH testing: (1) be processed to  
12 remove cells by centrifugation (or "spinning") "as soon as possible" into serum or plasma;  
13 (2) be stored after collection and centrifugation at room temperature for a maximum of 2  
14 hours as serum or 48 hours as plasma; (3) be stored after collection and centrifugation at 4  
15 degrees Celsius for a maximum of 6 or 8 hours as serum; or (4) be frozen either as serum or  
16 plasma immediately following collection and centrifugation. There is no allowance for  
17 storing samples for PTH testing as unprocessed whole blood.

18 63. Processing of the whole blood samples taken from dialysis patients for PTH  
19 testing into serum or plasma requires that the whole blood be "spun" in a centrifuge to  
20 separate the plasma from the red blood cells. The processing or "spinning" of the whole  
21 blood samples must occur before the sample is frozen. The NICHOLS' manufacturer's  
22 instructions or package insert for its PTH test kits requires that the whole blood samples be  
23 immediately processed ("spun") and stored as plasma or serum according to the specific  
24 temperature and time requirements outlined in paragraph 62 above.

25 **NICHOLS' INDUCEMENT OF THE VIOLATION OF FDA REGULATIONS BY**  
26 **ITS LABORATORY CUSTOMERS**

27 64. Despite the instruction in its manufacturer's instructions or package insert that  
28 whole blood be immediately processed ("spun") into plasma or serum, and frozen within 6 or

1 8 hours after collection (for serum) and stored at room temperature for a maximum of 48  
2 hours after collection (for plasma), NICHOLS, in combination with a laboratory customer  
3 (LifeChem Laboratory Services), published an abstract in the scientific journal *Clinical*  
4 *Chemistry* in 1995 to induce its laboratory customers to wait up to 24 hours before  
5 processing whole blood samples for PTH testing. The abstract further advised that following  
6 processing (centrifugation), plasma or serum samples could be stored at room temperature  
7 for 24, 48 or even 72 hours before testing.

8 65. In the *Clinical Chemistry* abstract, NICHOLS claimed to have conducted a  
9 study in which blood samples (not centrifuged and separated) were held at room temperature  
10 for "24 hours to simulate typical shipping conditions" from dialysis centers to laboratories.  
11 These whole blood samples were "spun" or processed into plasma after 24 hours at room  
12 temperature, and allowed to remain at room temperature an additional 24, 48 and 72 hours  
13 before being tested for PTH. The results from testing these samples were then compared  
14 against the results from testing "frozen serum specimens" taken from the same patients.

15 66. The result from this research advocated by Defendants NICHOLS was that  
16 allowing whole blood samples to remain at room temperature for 24 hours before processing  
17 into plasma or serum — that is, allowing unprocessed whole blood samples to remain at  
18 room temperature "for shipment" from dialysis centers to its customers' laboratories —  
19 produced results with a correlation of "less than one," but found that this lack of correlation  
20 was not statistically significant, permitting the purported conclusion that whole blood could  
21 be held at room temperature for 24 hours without centrifugation and separation, to allow for  
22 shipping from dialysis centers to its laboratory customers, before being processed into  
23 plasma or serum.

24 67. One of the authors of this *Clinical Chemistry* abstract, who is currently  
25 employed by NICHOLS, boasted in March 2002 that the alleged study in this abstract saved  
26 Defendant NICHOLS' laboratory customers large amounts of money by eliminating the cost  
27 and expense of processing or "spinning" the whole blood samples at their dialysis centers,  
28

1 and shipping frozen plasma or serum samples packed in dry ice from the dialysis centers to  
2 the laboratory for PTH testing.

3 **NICHOLS' LABORATORY CUSTOMERS' VIOLATION OF THE NICHOLS'**  
4 **MANUFACTURER'S INSTRUCTIONS**

5 68. As a direct result of NICHOLS' inducement, several of its major laboratory  
6 customers (representing PTH testing for over 50% of the approximately 330,000 dialysis  
7 patients in the United States) who purchase and use the NICHOLS' PTH test kits, provide  
8 written instructions to their own dialysis center employees that violate the NICHOLS PTH  
9 test kit manufacturer's instructions or package insert regarding the processing and storage of  
10 whole blood for PTH testing. Specifically, these instructions direct employees at the dialysis  
11 centers, that are either owned or controlled by the laboratories, not to process (spin) whole  
12 blood samples immediately as required by the NICHOLS' manufacturer's instructions and  
13 package insert NICHOLS submitted to the FDA.

14 69. The written instructions NICHOLS' laboratory customers provide to dialysis  
15 centers, while directly contrary to the NICHOLS' PTH test kit manufacturer's instructions  
16 and package insert, are consistent with the inducement provided by NICHOLS in the 1995  
17 *Clinical Chemistry* abstract that whole blood samples not be processed (centrifuged and  
18 separated) for up to 24 hours or assayed for up to 72 hours after collection. These  
19 instructions allow NICHOLS' laboratory customers to avoid the expense and cost of  
20 processing the whole blood at the dialysis centers and shipping the processed serum or  
21 plasma in dry ice to their laboratories. These instructions also unfairly impede laboratories,  
22 such as Scantibodies, that require compliance with their manufacturer's instructions --  
23 dictating that whole blood samples be processed into serum or plasma before shipment to a  
24 laboratory for PTH testing -- from competing in the PTH testing and lab services market.

25 70. Despite NICHOLS' laboratory customers' failure to comply with its  
26 manufacturer's instructions or package insert for its PTH test kits, and NICHOLS' knowledge  
27 of and inducement of this non-compliance by its laboratory customers, NICHOLS has not re-  
28 labeled its PTH test kit, and continued to submit manufacturer's instructions or package

1 inserts for its PTH test kits to the FDA in premarket notifications that violate the applicable  
2 labeling and intended use regulations.

3 **FIRST COUNTERCLAIM**

4 **(Declaratory Judgment of Invalidity and Non-Infringement)**

5 71. Scantibodies incorporates and realleges paragraphs 1-70 of its Answer,  
6 Affirmative Defenses and Counterclaims as if fully set forth herein.

7 72. This claim arises under the Federal Declaratory Judgment Act and the Patent  
8 Laws of the United States, and more particularly, under 28 U.S.C. §§ 2201 and 2202, and 35  
9 U.S.C. § 101 et seq.

10 73. There exists a justiciable controversy between Scantibodies and Nichols  
11 concerning whether the '790 patent is valid and enforceable, and if so, whether Scantibodies  
12 is liable to Nichols for infringement of any of the claims of the patent at issue.

13 74. Scantibodies seeks a declaration that the '790 patent is invalid and/or  
14 unenforceable.

15 75. In addition, or as further relief, Scantibodies seeks a declaration that Nichols  
16 is estopped from enforcing the '790 patent based on its own wrongful conduct and/or is  
17 barred from collecting damages under the patent due to laches, waiver, acquiescence or  
18 and/or misuse.

19 76. A judicial declaration is necessary and appropriate at this time in order that  
20 Scantibodies may ascertain its rights and duties with respect to the patent in suit.

21 **SECOND COUNTERCLAIM**

22 **(Violation of California Business & Professions Code Section 17200)**

23 77. Scantibodies incorporates and realleges paragraphs 1-76 of its Answer,  
24 Affirmative Defenses and Counterclaims as if fully set forth herein.

25 78. Scantibodies brings this claim in both its individual capacity and on behalf of the  
26 general public pursuant to California Business & Professions Code Section 17204.

27 79. Beginning in at least 1995 and continuing to the present, NICHOLS has  
28 committed acts of unfair competition, as that term is defined in California Business &

1 Professions Code Section 17200, by engaging in the following unlawful, unfair and  
2 fraudulent business acts: (1) failing to comply with the labeling requirements of 21 CFR §  
3 809.10 for the "storage, handling or shipping instructions for the protection and maintenance  
4 of stability" of blood samples collected from dialysis patients for PTH testing at its  
5 customers' laboratories; (2) failing to re-label its PTH test kits when it knew, or had  
6 knowledge of facts that gave it notice, that its PTH test kit was being used for conditions,  
7 purposes, or uses other than the ones for which the test kit was offered as stated in  
8 NICHOLS' manufacturer's instructions or package insert, in violation of 21 CFR § 801.4;  
9 and (3) inducing its laboratory customers to violate 42 CFR § 493 *et seq.* by inducing them to  
10 not follow the NICHOLS' manufacturer's instructions or package insert when storing and  
11 shipping samples collected from dialysis patients for PTH testing. These violations of the  
12 federal regulations controlling the labeling of NICHOLS' PTH test kits constitute unlawful,  
13 unfair and fraudulent business practices within the meaning of California Business &  
14 Professions Code Section 17200.

15 80. The harm to Scantibodies and to members of the general public outweighs the  
16 utility of Nichols' practice of failing to properly relabel its package insert or manufacturer's  
17 instructions to reflect the actual practice of its laboratory customers in processing and storing  
18 samples taken from dialysis patients for PTH testing, and therefore constitutes an unfair  
19 practice within the meaning of Business & Professions Code Section 17200.

20 81. Nichols' unlawful, unfair and fraudulent business practices, as described  
21 above, continue in that Nichols continues to sell its PTH test kits with the knowledge that its  
22 laboratory customers are failing to comply with its package insert or manufacturer's  
23 instructions for processing and storing patient samples. Scantibodies and other members of  
24 the public do have not an adequate remedy at law.

25 82. As a direct result of the above-described unlawful, unfair and fraudulent acts,  
26 NICHOLS has continued to dominate the sale of PTH test kits in California, and elsewhere, and  
27 also hindered Scantibodies' competition in the market for PTH testing and lab services. This has  
28

1 resulted in NICHOLS obtaining and holding ill-gotten gains through the sale of PTH test kits to  
2 its laboratory customers.

3 WHEREFORE, Scantibodies prays for judgment that:

4 **On Nichols' Complaint:**

5 (a) Nichols take nothing by way of its Complaint;

6 (b) Scantibodies does not infringe the '790 patent;

7 (c) the patents at issue are invalid and/or unenforceable against Scantibodies;

8 (d) Nichols is estopped from asserting that the patents at issue are infringed by  
9 Scantibodies;

10 (e) Nichols is barred from collecting damages under the '790 patent based on laches,  
11 waiver, acquiescence and/or misuse;

12 (f) Scantibodies be awarded its costs and attorney's fees; and

13 (g) Scantibodies be awarded such other and further relief as the Court may deem just  
14 and reasonable.

15 **On Scantibodies' Counterclaims:**

16 WHEREFORE, the defendant-counterplaintiff Scantibodies respectfully requests this  
17 court to find and rule:

18 (a) That, with respect to the First Counterclaim, the Court enter a declaratory  
19 judgment that the Scantibodies products do not infringe any of the claims of the '790 patent, and  
20 that

21 (i) the '790 patent is invalid;

22 (ii) the '790 patent is unenforceable against Scantibodies;

23 (iii) Nichols is estopped from asserting that the patent at issue is infringed by  
24 Scantibodies;

1 (iv) Nichols is barred from collecting damages under the '790 patent based on  
2 laches, waiver, acquiescence and/or misuse;

3 (v) Scantibodies be awarded its costs and attorney's fees; and

4 (vi) such other relief that this Court deems just and reasonable.

5 (b) That, with respect to the Second Counterclaim, the following relief be granted:

6 (i) Nichols be enjoined from engaging in the unlawful, unfair and fraudulent  
7 business practices stated in Paragraph 79, *supra*, pursuant to California Business & Professions  
8 Code Sections 17203 and the equitable powers of this Court;

9 (ii) Nichols be ordered to pay restitution of monies obtained from its unlawful,  
10 unfair and fraudulent business practices stated in Paragraph 79, *supra*, pursuant to California  
11 Business & Professions Code Sections 17203 and the equitable powers of this Court;

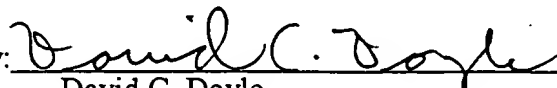

12 (iii) For attorneys fees pursuant to California Code of Civil Procedure Section  
13 1021.5; and

14 (iv) For costs of suit, and for such further relief as the Court may order.

15 Scantibodies requests a jury trial as to its counterclaims.

**NOTICE OF MOTION AND MOTION  
FOR SUMMARY JUDGMENT  
PURSUANT TO 35 U.S.C. § 102(f) FOR  
NONJOINDER OF CO-INVENTOR**

**[FED. R. CIV. P. 56]**

Date: July 15, 2002  
Time: 10:30 a.m.  
Courtroom 2

Hon. Rudi M. Brewster

1 TO PLAINTIFF NICHOLS INSTITUTE DIAGNOSTICS, INC., AND ITS  
2 ATTORNEY OF RECORD:

3 PLEASE TAKE NOTICE THAT on July 15, 2002 at 10:30 a.m., or as soon thereafter  
4 as the matter may be heard, in Courtroom 2 of the United States District Court for the  
5 Southern District of California located at 940 Front Street, San Diego, California, 92101,  
6 before the Honorable Rudi M. Brewster, Defendants Scantibodies Clinical Laboratory, Inc.  
7 and Scantibodies Laboratory, Inc. ("Scantibodies") will move, and hereby do move, for  
8 summary judgment against Plaintiffs.

9 The grounds for this motion are:

10 (1) The applicants for U.S. Patent No. 6,030,790 failed to identify and join all the  
11 inventors in their application to the United States Patent and Trademark Office;

12 (2) The '790 patent lists only three co-inventors on its face: Knut Adermann  
13 ("Adermann"), Dieter Hock ("Hock"), and Markus Mägerlein ("Mägerlein"). The '790 is the  
14 "national stage" of an earlier international patent application filed under the Patent  
15 Cooperation Treaty ("PCT"). As was appropriate under the PCT and the patent laws of the  
16 United States, '790 claimed the filing date of the earlier PCT Application. The PCT  
17 Application is the application for what ultimately issued as the '790 patent;

18 (3) Although the '790 patent originated in the PTO as the PCT Application -- and  
19 necessarily relied on the same disclosure -- the '790 patent does not name the same inventors.  
20 The PCT Application identified Adermann, Hock, Mägerlein *and Wolf-Georg Forssmann* as  
21 inventors. The '790, however, does not include Forssmann; and

22 (4) The omission of Forssmann from the national stage application in the United  
23 States renders the '790 patent invalid under 35 U.S.C. § 102(f) for nonjoinder of a co-  
24 inventor.

25 This motion is made pursuant to Rule 56 of the Federal Rules of Civil Procedure and  
26 is based upon this notice of motion and motion, the accompanying memorandum of points  
27 and authorities, the declaration of M. Andrew Woodmansee, the other pleadings and papers  
28

1 on file in this action, and such other evidence and argument as may subsequently be  
2 presented to the Court.

25 ☐ (BY MAIL) I caused each such envelope, with postage thereon fully prepaid, to be placed  
26 in the United States mail at San Diego, California. I am readily familiar with the practice of  
27 Morrison & Foerster LLP for collection and processing of correspondence for mailing, said  
28 practice being that in the ordinary course of business, mail is deposited in the United States Postal  
Service the same day as it is placed for collection.

☒ (BY PERSONAL SERVICE) I delivered to an authorized courier or driver authorized by  
ASAP Courier, Inc., 4250 Pacific Highway, Suite 120, San Diego, California 92110, to receive  
documents to be delivered on the same date. A proof of service signed by the authorized courier  
will be filed with the court upon request.

☐ (BY FEDERAL EXPRESS) I am readily familiar with the practice of Morrison &  
Foerster LLP for collection and processing of correspondence for overnight delivery and know  
that the document(s) described herein will be deposited in a box or other facility regularly  
maintained by Federal Express for overnight delivery.

☐ (BY FACSIMILE) The above-referenced document was transmitted by facsimile  
transmission and the transmission was reported as complete and without error. The facsimile  
machine I used complied with California Rules of Court, Rule 2003(3) and no error was reported

1 by the machine. Pursuant to California Rules of Court, Rule 2006(d), I caused the machine to  
2 print a transmission record of the transmission, a copy of which is attached to this declaration.

3 I declare under penalty of perjury under the laws of the United States of America that the  
4 foregoing is true and correct, and that this declaration is executed on May 16, 2002 at San Diego,  
5 California.

1 I. INTRODUCTION

2 Nichols Institute Diagnostics, Inc. ("Nichols") commenced this action for alleged  
3 infringement of U.S. Patent No. 6,030,790 (the "'790 patent"). But this case should go no  
4 further. Nichols' patent suffers from a fundamental flaw and is invalid on its face. The  
5 applicants for the '790 patent failed to identify and join all the inventors in their application  
6 to the United States Patent and Trademark Office ("PTO"). They failed to satisfy one of the  
7 fundamental conditions for obtaining a valid patent -- naming all the correct inventors. In  
8 other words, the applicants never properly "got off the starting blocks" in their efforts to  
9 obtain a valid patent from the PTO.

10 The issue presented in this motion is very straightforward. The Court need look only  
11 to the patent documents themselves to decide this discrete invalidity issue.

12 The '790 patent lists only three co-inventors on its face: Knut Adermann  
13 ("Adermann"), Dieter Hock ("Hock"), and Markus Mägerlein ("Mägerlein"). The '790 is the  
14 "national stage" of an earlier international patent application filed under the Patent  
15 Cooperation Treaty ("PCT"). The PCT provides a standard set of policies and procedures for  
16 filing a single application in multiple jurisdictions based on the same invention. 4 Donald  
17 Chisum, *Chisum on Patents*, § 14.02 [4] at n.1 (Cumm. Supp. Oct. 2001). In order for the  
18 '790 to claim the filing date of the PCT Application, it must have been the same application  
19 and the same subject matter. Indeed, as was appropriate under the PCT and the patent laws of  
20 the United States, the '790 claimed the filing date of the earlier PCT Application.

21 Although the '790 patent originated in the PTO as the PCT Application -- and was for  
22 the same invention -- the '790 patent does not name the same inventors. The PCT  
23 Application identified Adermann, Hock, Mägerlein *and Wolf-Georg Forssmann* as  
24 inventors. The '790, however, **does not include Forssmann**.

25 The omission of Forssmann from the U.S. application for the '790 patent renders it  
26 invalid under 35 U.S.C. § 102(f) as a matter of law. Having commenced an action based on  
27 an invalid patent, Nichols now has only two options: either promptly seek judicial correction  
28

1 of the inventorship error under the procedure set forth in 35 U.S.C. § 256 or have the '790  
2 patent declared invalid for nonjoinder of inventors. In either case, this costly lawsuit is  
3 premature and should proceed no further.

## 4 II. STATEMENT OF THE FACTS

5 On September 28, 1994, an application was filed with the German Patent Office,  
6 Federal Republic of Germany. See Ex. A attached to Declaration of M. Andrew  
7 Woodmansee in Support of Scantibodies Clinical Laboratory, Inc. and Scantibodies  
8 Laboratory, Inc.'s Motion for Summary Judgment Pursuant to 35 U.S.C. § 102(f)  
9 ("Woodmansee Decl."). That patent, DE 44 34 551 A1, identified four inventors on its face:  
10 Adermann, Hock, Mägerlein *and* Forssmann. *Id.* According to the abstract:

11 The invention relates to peptides from the human parathyroid  
12 (hPTH) sequence (1-37), containing  $\alpha$ -helical amino acid sequence  
13 regions, where said peptides are capable of inducing antibodies  
14 when injected into animals. The invention also relates to a  
diagnostic agent and antibodies obtainable by vaccination of  
animals with the peptides in question.

(Woodmansee Decl., Ex. A at p. 3)

15 The German patent (DE 44 34 555 A1) formed the basis for an application filed on  
16 September 22, 1995 with the World Intellectual Property Organization and published  
17 pursuant to the PCT. The PCT Application (WO 96/10041) claimed priority on its face to  
18 the 1994 German application. (Woodmansee Decl., Ex. B at p. 12) Like its German  
19 counterpart, the PCT named the same four inventors: Adermann, Hock, Mägerlein *and*  
20 *Forssmann*. (*Id.*) The abstract of the PCT Application described the same subject matter as  
21 the German application:

22 The invention concerns peptides from the human parathyroid  
23 (hPTH) sequence (1-37) and containing  $\alpha$ -helical amino acid  
24 sequence regions and/or non-structured amino acid sequence  
25 regions. The said peptides are capable of inducing antibodies when  
26 injected into animals. The invention also concerns a diagnostic  
agent and antibodies obtainable by vaccination of animals with the  
peptides in question.

(Woodmansee Decl., Ex. B at p. 12)

1 Based on the disclosure and filing date of the PCT Application (September 22, 1995),  
2 an application was filed with the United States Patent and Trademark Office. That  
3 application ultimately issued as the '790 patent. The abstract of the '790 patent describes its  
4 subject matter and claimed inventions as follows:

5 The present invention is directed to peptides from the sequence of  
6 hPTH (1-37), which contain  $\alpha$ -helical amino acid sequence regions  
7 and/or non-structured amino acid sequence regions, said peptides  
8 being capable of inducing antibodies when injected into animals.  
Furthermore, the invention is directed to a diagnostic agent and  
antibodies obtainable by immunizing animals using the peptides  
according to the invention.

9 (Woodmansee Decl., Ex. C at p. 30)

10 The application for the '790 patent was submitted to the PTO as the national stage of  
11 the PCT Application. The application claimed the benefit and filing date of the PCT  
12 Application. (*Id.*) Indeed, the named inventors on the application -- Adermann, Hock and  
13 Mägerlein -- submitted a declaration to the PTO claiming inventorship of the invention  
14 sought in the application and confirming that the specification of the invention had first been  
15 filed in the PCT Application. The inventors' declaration states, under penalty of perjury, in  
16 pertinent part:

17 As a below named inventor, I hereby declare that: . . . I believe I am  
18 an original, first and joint inventor (if plural names are listed below)  
19 of the subject matter which is claimed and for which a patent is  
20 sought on the invention entitled: "PEPTIDES FROM THE hPTH  
(1-37) SEQUENCE, the specification of which . . . was filed on  
September 22, 1995 as PCT International Application No.  
PCT/EP95/03757 . . . .

21 (Woodmansee Decl., Ex. D at p.62) (emphasis added).

22 The '790 patent identifies only three inventors, not four. (Woodmansee Decl., Ex. C  
23 at p. 30) The '790 patent identifies Adermann, Hock and Mägerlein as inventors. (*Id.*)  
24 Although he was named as an inventor in connection with the PCT Application (and the  
25 underlying German patent), Wolf-George Forssmann was never named as an inventor in  
26 connection with the application in the United States for the '790 patent.

### III. ARGUMENT

#### A. The Naming Of The Correct Inventors Is A Condition Of Patentability

In *Pannu v. Iolab Corp.*, 155 F.3d 1344 (Fed. Cir. 1998), the Federal Circuit explained the statutory basis requiring a finding of invalidity where a patent fails to name the correct inventors. The Federal Circuit explained that Section 102 establishes the “conditions of patentability” that must be satisfied in order to obtain a valid patent. *Id.* at 1348-49. In particular, Section 102(f) provides that “[a] person shall be entitled to a patent unless -- he did not himself invent the subject matter sought to be patented.” 35 U.S.C. § 102(f). “Since the word ‘he’ [in Section 102(f)] refers to the specific inventive entity named on the patent . . . this subsection **mandates that a patent accurately list the correct inventors of a claimed invention . . .**” *Pannu* at 1349 (emphasis added). “Accordingly, if nonjoinder of an actual inventor is proved by clear and convincing evidence, . . . **a patent is rendered invalid.**” *Id.* (citations omitted) (emphasis added).

Although the failure to name the correct inventors renders a patent invalid, the Patent Act provides a procedure for correcting inventorship errors that have been established in ongoing litigation. In *Pannu*, the Federal Circuit held that the operation of section 102(f) in the context of ongoing litigation is “ameliorated” by the ability to correct inventorship errors through a judicial hearing pursuant to section 256 of the Patent Act. *Id.* at 1350. “Upon such a finding of incorrect inventorship, a patentee may invoke section 256 to save the patent from invalidity.” *Id.* Specifically, the Federal Circuit acknowledged: “Non-joinder may be corrected ‘on notice and hearing of all the parties concerned’ and upon a showing that the error occurred without any deceptive intent on the part of the unnamed inventor.” 35 U.S.C. § 256. “If a patentee demonstrates that inventorship can be corrected as provided for in section 256, a district court must order correction of the patent, thus saving it from being rendered invalid.” *Id.* at 1350.

1                                    **B. The Undisputed Evidence Establishes That The '790 Patent**  
2                                    **Suffers From Nonjoinder Of An Inventor: Wolf-Georg**  
3                                    **Forssmann**

4                    When one compares the PCT Application with the initial application in the United  
5                    States for the '790 patent, it is apparent that Wolf-Georg Forssmann should have been named  
6                    as an inventor on the '790 patent. The application that issued as the '790 patent was the  
7                    "national stage" in the United States of PCT Application WO 96/10041. (*See, e.g.,*  
8                    Woodmansee Decl., Ex. C at p. 30; Ex. D at p. 62) The filing of the PCT Application in  
9                    1995 had the same effect as an application normally filed in the United States PTO. "An  
10                   international application designating the United States shall have the effect, from its  
11                   international filing date under article 11 of the treaty, of a national application for patent  
12                   regularly filed in the Patent and Trademark Office except as otherwise provided in section  
13                   102(e) of this title." 35 U.S.C. § 363; *see also Chisum* § 14.02 [4] (noting that, to commence  
14                   the "national phase" in the U.S. based on a prior PCT Application, the applicant must pay a  
15                   filing fee, file a copy of the international application and an English translation).

16                   "The general purpose of the PCT is to provide a single set of standards and  
17                   procedures for the filing of patent applications on the same invention in any of the over  
18                   ninety PCT member countries." *Chisum* § 14.02 [4]n.1 (quoting Department of Commerce,  
19                   Patent and Trademark Office, Revision of Patent Cooperation Treaty Application Procedure,  
20                   63 Fed. Reg. 66040, 66041 (Dec. 1, 1998)) (emphasis added). Because the PCT process is  
21                   intended to permit multi-jurisdictional patenting of the same invention, the inventorship of  
22                   the national stage application should follow the inventorship designation in the originating  
23                   country. *Chou v Univ. of Chicago*, 254 F.3d 1347, 1360 (Fed. Cir. 2001) (noting that  
24                   inventorship on PCT and foreign national stage applications "normally follows the  
25                   inventorship designation in the originating country").

26                   Although '790 was the same application and the same invention as the PCT and the  
27                   underlying German patent, Forssmann was not named as an inventor on the '790 patent.  
28                   (Woodmansee Decl., Ex. C at p. 30; Ex. D at pp. 62-63) Only Adermann, Hock and

1 Mägerlein were named as inventors on the U.S. application. (Woodmansee Decl., Ex. D at  
2 pp. 62-63) Only Adermann, Hock and Mägerlein signed declarations with inventor's oaths  
3 in connection with the U.S. application. (*Id.*) Although Forssmann was listed as an inventor  
4 on the PCT Application (and on the underlying German patent), he was not named in  
5 connection with the U.S. application and he did not sign a declaration and inventorship oath.  
6 Given the legal relationship between the PCT Application and the application for the '790  
7 patent -- the same application for the same invention -- Forssmann should have been an  
8 inventor of the subject matter disclosed and claimed in the '790 patent. *See, e.g., Chou* at  
9 1360.<sup>1</sup>

10 It is clear that Forssmann should have been named as an inventor on the application  
11 that issued as the '790 patent. He was not. The application for the '790 patent therefore  
12 failed to meet one of the most basic requirements for patentability -- naming all the correct  
13 inventors. The '790 patent is invalid and unenforceable unless Nichols seeks to correct the  
14 omission in this Court pursuant to section 256. *Pannu* at 1349.

15 **C. Nichols Must Either Immediately Move To Correct The**  
16 **Inventorship Error In Court Or Have The Patent Declared**  
17 **Invalid**

18 Because correct inventorship is a condition of patentability, a patentee cannot enforce a  
19 patent until it has taken the corrective steps required by statute. *Id.* at 1349 (holding that patentee  
20 "must claim entitlement to relief under the statute" or have its patent declared invalid); *see also*  
21 *Merry Mfg. Co. v. Burns Tool Co.*, 335 F. 2d 239, 242 (5th Cir. 1964) ("The patent is  
22 unenforceable-until corrective steps are taken" and if correction cannot be made "the

23 \_\_\_\_\_  
24 <sup>1</sup> Nichols may attempt some explanation for its failure to follow the normal rule that  
25 inventorship of national stage applications follows the inventorship designation in the originating  
26 country. Scantibodies submits that there is no reasonable explanation for applicants' failure to  
27 name Forssmann as an inventor of the '790 patent in light of the identical subject matter

(Footnote continues on following page.)

unenforceability ripens into invalidity”); *Mas-Hamilton Group v. LaGard, Inc.*, 21 F. Supp.2d 700, 711 (E.D.Ky. 1997) (“Such a patent with inventorship defects is unenforceable until corrective steps are taken.”).

Although section 256 provides an opportunity to correct inventorship errors, Nichols cannot avoid summary judgment by asserting that the patent *might* still be corrected at the PTO. In *Pannu*, the Federal Circuit held that the mere possibility of correction under section 256 does not allow a patentee to escape invalidation of a patent due to misjoinder. In order to avoid a finding of invalidity by this Court, Nichols must immediately commence an action for judicial correction upon notice and hearing of all concerned parties.

[A] patent with improper inventorship does not avoid invalidation simply because it might be corrected under section 256. Rather, the patentee *must claim entitlement to relief under the statute and the court must give the patentee an opportunity to correct the inventorship*. If the inventorship is successfully corrected, section 102(f) will not render the patent invalid. On the other hand, if the patentee does not claim relief under the statute and a party asserting invalidity proves incorrect inventorship, the court should hold the patent invalid for failure to comply with section 102(f).

*Pannu* at 1350-51 (emphasis added). The Federal Circuit held in the context of ongoing litigation “[n]onjoinder may be corrected ‘on notice and hearing of all parties concerned.’” *Id.* at 1350. Now that incorrect inventorship has been raised in this action, that hearing can only take place in this Court.

In short, Nichols is before this Court with a clearly invalid and/or unenforceable patent. Nichols should not be allowed to proceed with an action for infringement of the ’790 patent under that circumstance. Nichols has two choices: either it must immediately commence an action for

---

(Footnote continued from previous page)

described in the related applications, and looks forward to addressing whatever excuses Nichols may proffer.

1 judicial correction of inventorship under section 256, or else face this Court's ruling that the '790  
2 patent is invalid for incorrect inventorship. *See id.*

3 A similar situation was addressed by the Massachusetts district court in *PerSeptive*  
4 *Biosystems v. Pharmacia Biotech*, 12 F. Supp.2d 69 (D.Mass. 1998). In *PerSeptive Biosystems*,  
5 the district court granted defendant's cross-motion for summary judgment that plaintiff's patents  
6 were invalid for nonjoinder of the true inventors. *Id.* at 75. The court ordered the plaintiff to  
7 move to correct inventorship pursuant to section 256 within ten days of the summary judgment  
8 order, or the action would be dismissed. *Id.* at 87. Plaintiff subsequently moved for judicial  
9 correction in the district court.  
10

11 Scantibodies respectfully requests that this Court follow a similar procedure in this case.  
12 In light of the undisputed evidence and the Federal Circuit's ruling in *Pannu*, Scantibodies  
13 requests that the Court require Nichols to commence within ten days an action for judicial  
14 correction of inventorship pursuant to section 256 on notice and hearing of all interested parties.  
15 If Nichols does not promptly do so, Scantibodies requests that the Court enter summary judgment  
16 of the invalidity of the '790 patent under section 102(f). *Pannu* at 1350-51.  
17

18  
19 **D. If Nichols Seeks Judicial Correction Of Inventorship, The**  
20 **Infringement Action Should Be Stayed Pending Hearing On**  
21 **Inventorship Issues**

22 Assuming Nichols does seek judicial correction pursuant to section 256, Scantibodies  
23 requests that the action against it for allegedly infringing the '790 patent be stayed pending  
24 full discovery and hearing of the inventorship issues. A costly action for infringement of a  
25 patent that is invalid for nonjoinder of inventors is "premature" while the inventorship  
26 remains uncorrected. *See Burroughs Wellcome Co. v. Barr Lab.*, 40 F.3d 1223, 1227 (Fed.  
27 Cir. 1994) ("If Barr and Novopharm are correct, then [the omitted inventors] should have  
28 been named as joint inventors and the resolution of Burroughs Wellcome's infringement suit

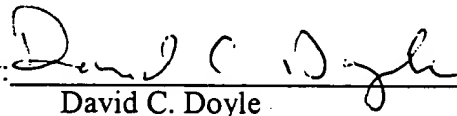

1 is premature.”). Scantibodies should not be forced to spend any additional sums on a  
2 premature infringement suit that should not even have been filed unless and until the  
3 nonjoinder of true inventors had been corrected.

4 **IV. CONCLUSION**

5 This motion presents a simple issue as to which there can be no genuine disputes.  
6 The '790 patent is invalid due to nonjoinder of Forssmann. Nichols must now seek judicial  
7 correction of inventorship on notice and hearing of all concerned parties or have its patent  
8 declared invalid pursuant to section 102(f). In either case, Nichols should not be permitted to  
9 force Scantibodies to expend further resources on an infringement action that is, as a matter  
10 of law, premature.
